## **Duality 3**

*There are concepts much more difficult to grasp than duality in linear programming.*

**-- Jim Orlin**

*The concept [of nonduality], often described in English as "nondualism," is extremely hard for the mind to grasp or visualize, since the mind engages constantly in the making of distinctions and nondualism represents the rejection or transcendence of all distinctions.*

# Rules for creating a dual linear program

## The Primal LP

$$\begin{array}{ll}
 \text{Maximize } z = & 1 x_1 + 2 x_2 + 3 x_3 + 4 x_4 \\
 \text{subject to} & 8 x_1 + 9 x_2 + 10 x_3 + 11 x_4 \quad ? \quad 5 \\
 & 12 x_1 + 13 x_2 + 14 x_3 + 15 x_4 \quad ? \quad 6 \\
 & 16 x_1 + 17 x_2 + 18 x_3 + 19 x_4 \quad ? \quad 7 \\
 & x_1 ? \quad x_2 ? \quad x_3 ? \quad x_4 ?
 \end{array}$$

Dual  
Variable

$y_1$

$y_2$

$y_3$

## The Dual LP

$$\begin{array}{ll}
 \text{Minimize } v = & 5 y_1 + 6 y_2 + 7 y_3 \\
 \text{subject to} & 8 y_1 + 12 y_2 + 16 y_3 \quad ? \quad 1 \\
 & 9 y_1 + 13 y_2 + 17 y_3 \quad ? \quad 2 \\
 & 10 y_1 + 14 y_2 + 18 y_3 \quad ? \quad 3 \\
 & 11 y_1 + 15 y_2 + 19 y_3 \quad ? \quad 4 \\
 & y_1 ? \quad y_2 ? \quad y_3 ?
 \end{array}$$

# The SOB approach sensible, odd, and bizarre

## The Primal LP

$$\text{Max } z = 1x_1 + 2x_2 + 3x_3 + 4x_4$$

$$\text{s.t. } 8x_1 + 9x_2 + 10x_3 + 11x_4 \leq 5$$

$$12x_1 + 13x_2 + 14x_3 + 15x_4 = 6$$

$$16x_1 + 17x_2 + 18x_3 + 19x_4 \geq 7$$

$$x_1 \geq 0, \quad x_2 \geq 0, \quad x_3 \text{ uis}, \quad x_4 \leq 0 ?$$

Benjamin

## The Primal LP

$$\text{Maximize } z = 1x_1 + 2x_2 + 3x_3 + 4x_4$$

$$\text{subject to } 8x_1 + 9x_2 + 10x_3 + 11x_4 \quad \boxed{a} \quad 5$$

$$12x_1 + 13x_2 + 14x_3 + 15x_4 \quad \boxed{b} \quad 6$$

$$16x_1 + 17x_2 + 18x_3 + 19x_4 \quad \boxed{c} \quad 7$$

$$x_1 \boxed{d} \quad x_2 \boxed{e} \quad x_3 \boxed{f}, \quad x_4 \boxed{g}$$

## The Dual LP

$$\text{Minimize } v = 5y_1 + 6y_2 + 7y_3$$

$$\text{subject to } 8y_1 + 12y_2 + 16y_3 \quad \boxed{d} \quad 1$$

$$9y_1 + 13y_2 + 17y_3 \quad \boxed{e} \quad 2$$

$$10y_1 + 14y_2 + 18y_3 \quad \boxed{f} \quad 3$$

$$11y_1 + 15y_2 + 19y_3 \quad \boxed{g} \quad 4$$

$$y_1 \boxed{a} \quad y_2 \boxed{b} \quad y_3 \boxed{c}$$

# Shadow Price Method

## The Primal LP

$$\begin{aligned}
 \text{Maximize } z = & 1 x_1 + 2 x_2 + 3 x_3 + 4 x_4 \\
 \text{subject to } & 8 x_1 + 9 x_2 + 10 x_3 + 11 x_4 \leq 5 \\
 & 12 x_1 + 13 x_2 + 14 x_3 + 15 x_4 = 6 \\
 & 16 x_1 + 17 x_2 + 18 x_3 + 19 x_4 \geq 7 \\
 & x_1 \boxed{d} \quad x_2 \boxed{e} \quad x_3 \boxed{f}, \quad x_4 \boxed{g}
 \end{aligned}$$

RHS of constraint (1) increases from 5 to 5.1 implies  
 Primal LP is less constrained implies  
 z increases or stays the same implies  $y_1 \geq 0$ .

RHS of constraint (3) increases from 7 to 7.3 implies  
 Primal LP is \_\_\_\_\_ implies  
 z \_\_\_\_\_ implies  $y_3$  \_\_\_\_\_

## Another Primal-Dual Pair

- Jane Jetson is trying to design a diet for George on her home food dispenser so as to satisfy requirements and minimize cost.

	Space Burgers	Saturn Shakes	Venus Flies	Requirements
Carbs	4	2	0	12
Fat	3	4	0	8
Protein	4	1	2	20
Cost (in \$100s)	5	4	2	

# Jane's Linear Program

$x_1$  = number of Spaceburgers

$x_2$  = number of Saturn Shakes

$x_3$  = number of Venus Flies

$$\begin{aligned} \text{minimize } z &= 5x_1 + 4x_2 + 2x_3 \\ \text{subject to } &4x_1 + 2x_2 + \phantom{0x_3} \geq 12 \\ &3x_1 + 4x_2 + \phantom{0x_3} \geq 8 \\ &4x_1 + 1x_2 + 2x_3 \geq 20 \\ &x_1, x_2, x_3 \geq 0 \end{aligned}$$

## Primal Linear Program

$$\begin{aligned} \min \quad z &= 5x_1 + 4x_2 + 2x_3 \\ \text{s.t} \quad & 4x_1 + 2x_2 + \phantom{2x_3} \geq 12 \quad \text{carbs} \quad p_1 \\ & 3x_1 + 4x_2 + \phantom{2x_3} \geq 8 \quad \text{fat} \quad p_2 \\ & 4x_1 + 1x_2 + 2x_3 \geq 20 \quad \text{protein} \quad p_3 \\ & x_1, x_2, x_3 \geq 0 \end{aligned}$$

## Dual Linear Program

$$\begin{aligned} \text{Max} \quad v &= 12p_1 + 8p_2 + 20p_3 \quad \text{cost of nutrients} \\ \text{s.t} \quad & 4p_1 + 3p_2 + 4p_3 \leq 5 \quad \text{burgers} \\ & 2p_1 + 4p_2 + 1p_3 \leq 4 \quad \text{shakes} \\ & \phantom{2p_1 + 4p_2} + 2p_3 \leq 2 \quad \text{flies} \\ & p_1, p_2, p_3 \geq 0 \end{aligned}$$

**Spacely Sprockets has decided to make food pellets. Mr. Spacely wants to Jane to buy all foods from him. How should he price them to maximize profit and so that Jane is willing to purchase all foods from him?**

### **Dual Linear Program**

$$\text{Max } z = 12 p_1 + 8 p_2 + 20 p_3$$

$$\text{s.t } 4 p_1 + 3 p_2 + 4 p_3 \leq 5$$

$$2 p_1 + 4 p_2 + 1 p_3 \leq 4$$

$$2 p_3 \leq 2$$

$$p_1, p_2, p_3 \geq 0$$

**cost of pellets**

**Spaceburgers**

**Saturn shakes**

**Venus flies**

# Complementary Slackness Conditions

Let  $x^*$  denote a primal feasible solution.

Let  $p^*$  denote a dual feasible solution.

Complementary slackness conditions.

1. For all  $i$ , if the  $i$ -th constraint is an inequality constraint that is not tight at the optimum solution, then  $p_i^* = 0$ .
2. If the  $x_j^* > 0$ , then the  $j$ -th constraint of the dual problem is tight, and thus the reduced cost of  $x_j^*$  is 0.

**Theorem.** *If  $x^*$  and  $p^*$  are optimal primal and dual solutions, then they satisfy the complementary slackness conditions.*

# Complementary Slackness Conditions

$$\begin{array}{llll} \min v = & 5x_1 + 4x_2 + 2x_3 & & \\ \text{s.t} & 4x_1 + 2x_2 + & \geq 12 & \text{carbs} \\ & 3x_1 + 4x_2 + & \geq 8 & \text{fat} \\ & 4x_1 + 1x_2 + 2x_3 & \geq 20 & \text{protein} \\ & x_1, x_2, x_3 \geq 0 & & \end{array}$$

**Opt Solution:  $x_1 = 3, x_2 = 0, x_3 = 4, z = 23$**

**What does complementary slackness tell us about the optimal dual variables (also known as shadow prices)? Discuss it with your neighbor.**

**$p_2 = 0$ ; the reduced costs of  $x_1$  and  $x_3$  are 0.**

**$p_2 = 0$ ;  $4p_1 + 3p_2 + 4p_3 = 5$ ;  $2p_3 = 2$ .**

## More on complementary slackness

- If there is a unique optimum tableau, then the complementary slackness conditions will give the equations for a unique optimum dual solution.

### Dual Linear Program

$$\begin{aligned} \text{Max } z &= 12 p_1 + 8 p_2 + 20 p_3 \\ \text{s.t } & 4 p_1 + 3 p_2 + 4 p_3 \leq 5 \\ & 2 p_1 + 4 p_2 + 1 p_3 \leq 4 \\ & 2 p_3 \leq 2 \\ & p_1, p_2, p_3 \geq 0 \end{aligned}$$

$$\begin{aligned} p_2 &= 0; \\ 4 p_1 + 3 p_2 + 4 p_3 &= 5; \\ 2 p_3 &= 2. \end{aligned}$$

$$\begin{aligned} p_2 &= 0 \\ p_3 &= 1 \\ p_1 &= 1/4 \end{aligned}$$

# Theorem on Complementary Slackness

If  $x^*$  is feasible for the primal, and if  $p^*$  is feasible for the dual, and if the pair  $(x^*, p^*)$  satisfy complementary slackness conditions, then

1.  $x^*$  is optimal for the primal problem and
2.  $p^*$  is optimal for the dual problem

**Primal solution:**

$$x_1 = 3$$

$$x_2 = 0$$

$$x_3 = 4$$

**Dual Solution**

$$p_1 = \frac{1}{4}$$

$$p_2 = 0$$

$$p_3 = 1$$

The complementary slackness conditions are satisfied. Thus they are both optimal.

# Complementary Slackness: An alternative representation

**Primal solution:**

$$x_1 = 3$$

$$x_2 = 0$$

$$x_3 = 4$$

**Dual Solution**

$$p_1 = \frac{1}{4}$$

$$p_2 = 0$$

$$p_3 = 1$$

$$x_1 \times (4 p_1 + 3 p_2 + 4 p_3 - 5) = 0$$

$$3 \times 0 = 0$$

$$x_2 \times (2 p_1 + 4 p_2 + 1 p_3 - 4) = 0$$

$$0 \times -2.5 = 0$$

$$x_3 (2 p_3 - 2) = 0$$

$$4 \times 0 = 0$$

# Mental Break

# The Dual Simplex Algorithm

<b>z</b>	<b>x<sub>1</sub></b>	<b>x<sub>2</sub></b>	<b>x<sub>3</sub></b>	<b>x<sub>4</sub></b>			
<b>1</b>	<b>3</b>	<b>-2</b>	<b>0</b>	<b>0</b>	=	<b>0</b>	<b>Objective function.</b>
<b>0</b>	<b>-3</b>	<b>3</b>	<b>1</b>	<b>0</b>	=	<b>6</b>	<b>Constraint 1</b>
<b>0</b>	<b>-4</b>	<b>2</b>	<b>0</b>	<b>1</b>	=	<b>2</b>	<b>Constraint 2</b>

If there are  $m$  constraints, a **basic solution** has  $m$  basic variables.

The basic solution is obtained by setting the nonbasic variables to 0, and solving the system of equations.

# Basic Feasible Solutions

z	x <sub>1</sub>	x <sub>2</sub>	x <sub>3</sub>	x <sub>4</sub>	
1	3	-2	0	0	= 0
0	-3	3	1	0	= 6
0	-4	2	0	1	= 2

z	x <sub>1</sub>	x <sub>2</sub>	x <sub>3</sub>	x <sub>4</sub>	
1	-1	0	0	1	= 2
0	3	0	1	-1.5	= 3
0	-2	1	0	.5	= 1

A solution is called a **basic feasible solution**, (bfs) if it is a basic solution and if it satisfies the nonnegativity constraints.

Another bfs

# Basic Dual Feasible Bases

z	x <sub>1</sub>	x <sub>2</sub>	x <sub>3</sub>	x <sub>4</sub>	
1	3	-2	0	0	= 0
0	-3	3	1	0	= 6
0	-4	2	0	1	= 2

z	x <sub>1</sub>	x <sub>2</sub>	x <sub>3</sub>	x <sub>4</sub>	
1	1	0	2/3	0	= 4
0	-1	1	1/3	0	= 2
0	-2	0	-2/3	1	= -2

A solution is called a **basic dual feasible solution**, if it is a basic solution and if it satisfies the optimality conditions with the z-row coefficients  $\geq 0$  (reduced costs are non-negative.)

This tableau gives a **basic dual feasible solution**. The primal basic solution is  $x_2 = 2$  and  $x_4 = -2$ , and so it is not a bfs.

How did you know where to pivot to get that dual feasible basis?

Where are the dual variables?

Why are we learning this?

Tim

There is no general rule on where to pivot. Just focus on the fact that it shows it is a basic dual solution.

The dual variables are "hidden". They are the simplex multipliers.

We are learning this to learn the dual simplex algorithm.

Ollie,  
the computationally  
wise owl.

22

# Pivoting in the Dual Simplex Algorithm

<b>z</b>	<b>x<sub>1</sub></b>	<b>x<sub>2</sub></b>	<b>x<sub>3</sub></b>	<b>s<sub>1</sub></b>	<b>s<sub>2</sub></b>	<b>s<sub>3</sub></b>		<b>RHS</b>
<b>1</b>	<b>-52</b>	<b>-30</b>	<b>-20</b>	<b>0</b>	<b>0</b>	<b>0</b>	<b>=</b>	<b>0</b>
<b>0</b>	<b>2</b>	<b>4</b>	<b>5</b>	<b>1</b>	<b>0</b>	<b>0</b>	<b>=</b>	<b>100</b>
<b>0</b>	<b>1</b>	<b>1</b>	<b>1</b>	<b>0</b>	<b>1</b>	<b>0</b>	<b>=</b>	<b>30</b>
<b>0</b>	<b>10</b>	<b>5</b>	<b>2</b>	<b>0</b>	<b>0</b>	<b>1</b>	<b>=</b>	<b>204</b>

Zor's  
initial  
tableau

<b>z</b>	<b>x<sub>1</sub></b>	<b>x<sub>2</sub></b>	<b>x<sub>3</sub></b>	<b>s<sub>1</sub></b>	<b>s<sub>2</sub></b>	<b>s<sub>3</sub></b>		<b>RHS</b>	<b>Prices</b>
<b>1</b>	<b>48</b>	<b>20</b>	<b>0</b>	<b>0</b>	<b>0</b>	<b>10</b>	<b>=</b>	<b>2040</b>

<b>0</b>	<b>-4</b>	<b>-1.5</b>	<b>0</b>	<b>0</b>	<b>1</b>	<b>-0.5</b>	<b>=</b>	<b>-72</b>	<b>0</b>
<b>0</b>	<b>5</b>	<b>2.5</b>	<b>1</b>	<b>0</b>	<b>0</b>	<b>0.5</b>	<b>=</b>	<b>102</b>	<b>10</b>

A dual feasible tableau

## A Dual Feasible Pivot

<b>z</b>	<b>x<sub>1</sub></b>	<b>x<sub>2</sub></b>	<b>x<sub>3</sub></b>	<b>s<sub>1</sub></b>	<b>s<sub>2</sub></b>	<b>s<sub>3</sub></b>		<b>RHS</b>
<b>1</b>	48	20	<b>0</b>	<b>0</b>	<b>0</b>	10	=	2040
<b>0</b>	-23	-8.5	0	1	0	-2.5	=	-410
<b>0</b>	-4	-1.5	0	0	1	-0.5	=	-72
<b>0</b>	5	2.5	1	0	0	0.5	=	102

A dual feasible tableau

<b>1</b>	48 -	20-	<b>0</b>	<b>0</b>	$\Delta$	10 -	=	2040 -
	4 $\Delta$	1.5 $\Delta$				.5 $\Delta$		72 $\Delta$

**Step 1. Choose a row that is an infeasible constraint.**

**Step 2. Add  $\Delta$  times that row to the z-row.**

**Step 3. Choose  $\Delta$  maximum so that all coefficients are non-negative. This determines the pivot column.**

## Finding the max value of $\Delta$ .

z	$x_1$	$x_2$	$x_3$	$s_1$	$s_2$	$s_3$		RHS
1	48	20	0	0	0	10	=	2040
0	-23	-8.5	0	1	0	-2.5	=	-410
0	-4	-1.5	0	0	1	-0.5	=	-72
0	5	2.5	1	0	0	0.5	=	102

1	48 - 4 $\Delta$	20 - 1.5 $\Delta$	0	0	$\Delta$	10 - .5 $\Delta$	=	2040 - 72 $\Delta$
---	--------------------	----------------------	---	---	----------	---------------------	---	-----------------------

48/4

20/1.5

10/.5

$s = \operatorname{argmin} \{ \bar{c}_j / \bar{a}_{2j} : \bar{a}_{2j} < 0 \}. \quad \{48/4, 20/1.5, 10/.5\}.$

$s = 1.$  Pivot on the component in constraint 2, column  $x_1$ .

If  $\bar{a}_{2j} \geq 0$ , the dual is unbounded from below, and the primal is infeasible.

# The Dual Simplex Pivot

<b>z</b>	<b>x<sub>1</sub></b>	<b>x<sub>2</sub></b>	<b>x<sub>3</sub></b>	<b>s<sub>1</sub></b>	<b>s<sub>2</sub></b>	<b>s<sub>3</sub></b>		<b>RHS</b>
1	0	2	0	0	12	4	=	1176
0	0	1/8	0	1	-23/4	3/8	=	4
0	1	3/8	0	0	-1/4	1/8	=	18
0	0	5/8	1	0	5/4	-1/8	=	12

Divide constraint 2 by -4.

Subtract 48 times the new constraint 2 from the z-row

Add 23 times the new constraint 2 to constraint 1.

Subtract 5 times the new constraint 2 from constraint 31.

The resulting tableau will be dual feasible. If it is also a bfs, then it is optimal, and we can quit. Otherwise keep pivoting.

## Another dual simplex pivot

<b>z</b>	<b>x<sub>1</sub></b>	<b>x<sub>2</sub></b>	<b>x<sub>3</sub></b>	<b>s<sub>1</sub></b>	<b>s<sub>2</sub></b>	<b>s<sub>3</sub></b>		<b>RHS</b>
<b>1</b>	<b>2</b>	<b>3</b>	<b>1</b>	<b>0</b>	<b>0</b>	<b>0</b>	<b>=</b>	<b>5</b>
<b>0</b>	<b>2</b>	<b>4</b>	<b>5</b>	<b>1</b>	<b>0</b>	<b>0</b>	<b>=</b>	<b>10</b>
<b>0</b>	<b>-2</b>	<b>-1</b>	<b>1</b>	<b>0</b>	<b>1</b>	<b>0</b>	<b>=</b>	<b>-3</b>
<b>0</b>	<b>1</b>	<b>1</b>	<b>1</b>	<b>0</b>	<b>0</b>	<b>1</b>	<b>=</b>	<b>-2</b>

1. Does this tableau give an upper bound on the optimal primal objective value?
2. What happens if we choose the second constraint as the pivot row?
3. What happens if we choose the third constraint as the pivot row?

# Answers

**Answer 1. The optimal primal value is at most 5 because  $z + 2x_1 + 3x_2 + x_3 = 5$  and  $x \geq 0$ .**

**What happens if we choose the second constraint as the pivot row?**

**The min ratio test gives  $\min \{2/2, 3/1\} = 1$**

**The column giving the min ratio is the column for  $x_1$ .  
So, we pivot on the -2**

**What happens if we choose the third constraint as the pivot row?**

**The min ratio test gives nothing. The dual is unbounded.**

**The constraint is “ $x_1 + x_2 + x_3 + s_1 = -2$ ”**

**The primal has no feasible solution.**

# Comments on the Dual Simplex Algorithm

- **Alternative to primal simplex algorithm in which we relax primal feasibility, but require the z-row to satisfy the optimality conditions.**
- **Dual simplex pivot rule: determined by a min ratio test.**
- **Very efficient in practice for lots of large problems (great alternative to primal simplex)**
- **If add an inequality constraint to an LP, the current basis may not be a bfs, but it stays dual feasible. (Very common in integer programming.)**
  - **The old basis can be used as a starting point for the dual simplex method**

**And now, it's time for .....**
