Relativistic dynamics summary:

Dynamics toolbox: formula summary

• Mass-energy unification:

$$E = mc^2 = m_0 \gamma c^2$$

• Momentum 4-vector:

$${f P}\equiv m_0{f U}=\left(egin{array}{c} p_x\ p_y\ p_y\ p_z\ E/c\end{array}
ight)$$

• Energy formula:

$$E = \sqrt{(m_0 c^2)^2 + (cp)^2}$$

• Velocity formula:

$$\beta = \frac{cp}{E}$$

MIT Course 8.033, Fall 2006, Lecture 12 Max Tegmark

Today's topics:

- Atomic, nuclear & particle physics
- Parallel & transverse acceleration & force
- Particle accelerators

FOCUS OF PARTICLE PHYSICS COMPONENT OF 8.033:

- 1) Give you basic overview of atomic, nuclear & particle physics so that you can
 - 1) Better see the big picture
 - 2) Get more out of popular talks and articles
 - 3) Pass the "cocktail party test"
- 2) Apply two core relativity results:
 - 1) Mass-energy unification
 - 2) Energy-momentum conservation

Atomic physics

How do we know what stars are made of?

Figure by MIT OCW.

Photons

Photoelectric effect

- Einstein's model was that
 - the photon carries energy $h\nu$
 - a certain work W_e is required to liberate an electron from the metal

Photoelectric effect

Photoelectric effect Lenard 1902

Photoelectric effect

- Einstein's model was that
 - the photon carries energy $h\nu$
 - a certain work W_e is required to liberate an electron from the metal
- This explained both of Lenard's 1902 observations:
 - light with frequency $h\nu < W_e$ liberates no electrons at all
 - light with frequency $h\nu > W_e$ liberates electrons with kinetic energy $h\nu W_e$.
 - increasing the *intensity* of the light (the photon flux) didn't affect the existence of liberated electrons or their kinetic energy
- Bottom line: we can treat the photon as just another particle.

(PS6, problem 6)

Working with photons: (PS6, problem 4)

• Photon 4-vector:

$$\mathbf{P}=\hbar\left(egin{array}{c} \mathbf{k}\ k\end{array}
ight),$$

where $k = \omega/c$.

- So p = E/c for photons.
- Comparing P with the wave 4-vector K shows that

$\mathbf{P}=\hbar\mathbf{K}.$

This relation in fact holds for *all* particles, even massive ones — as you'll see when you get to wave-particle duality in quantum mechanics. If you take a field theory course, you'll see this pop right out of the so-called Klein-Gordon equation.

• Doppler effect is just special case of P-transformation for zero rest mass — show on PS6.

Nuclear physics

Nuclear physics terminology

- The *atomic number* Z of a nucleus is its number of protons.
- The *atomic weight* A of a nucleus is its number of nucleons (protons + neutrons).
- Z determines the name of the element (its order in the periodic table).
- Nuclei with same Z and different A are said to be different *isotopes* of the same element.
- Notation example: Fe⁵⁶ means Z = 26 (iron) and A = 56.
- The mass excess for a nucleus is $m_0 A$ amu, *i.e.*, its rest mass minus the number of nucleons times amu.
- By this definition, the mass excess of C^{12} is zero.

(PS6, problem 1)

Rest mass and binding energy

- The rest energy of an object is its energy in the frame where it has zero momentum.
- This rest energy is the sum of *all* energy contributions, both positive (like rest masses and kinetic energies of its constituent particles) and negative (like potential energy from force holding constituents together).
- The *binding energy* of a nucleus is rest energy of its neutrons and protons free minus rest energy of the nucleus.

- $m_n \approx 939.6 \text{ MeV} (\text{udd})$
- $m_p \approx 938.3 \text{ MeV} (\text{uud})$
- $m_u \approx 4 \text{ MeV}$
- $m_d \approx 7 \text{ MeV}$
- Electromagnetic $\approx 1.7 \text{ MeV}$
- So mostly glue!
- Electric repulsion between protons *increases* mass of nucleus.
- Attraction between nucleons (strong force) *decreases* mass of nucleus.
- Only nuclei whose (Z, A) give positive binding energy can exist
- Semi-empirical relationship (von Weizsäcker 1935):

$$\frac{E_{\text{binding}}}{c^2} \approx \left[15.8A - 18.3A^{2/3} - 0.714\frac{Z^2}{A^{1/3}} - 23.2\frac{(A - 2Z)^2}{A} + (-1)^Z \frac{12}{A^{1/2}}\right] \text{MeV}$$

The last term is omitted if A is an odd number.

• Much work remains to be done in this field!
