

CHAPTER 3

Problem 3.1

3.1 a)

$$k = \frac{\ln 2}{t_{\frac{1}{2}}} = \frac{\ln 2}{5730 \text{ years}} = 1.2 \times 10^{-4} \text{ years}^{-1}$$

3.1 b)

If 73% of ^{14}C remains, $\frac{C}{C_0} = 0.73$

$$\ln \frac{C}{C_0} = -kt$$

$$t = -\frac{\ln(0.73)}{1.2 \times 10^{-4} \text{ years}^{-1}} = 2,623 \text{ years}$$

Note: For simplicity, this problem assumes a constant input of C-14 (perturbations due to bomb C-14 are not considered).

Problem 3.2

$$V = \frac{V_{\max} [S]}{K_M + [S]}$$

$$\frac{1}{V} = \frac{K_M + [S]}{V_{\max} [S]} = \frac{K_M}{V_{\max}} \cdot \frac{1}{[S]} + \frac{1}{V_{\max}}$$

Plot such that $y = \frac{1}{V}$ and $x = \frac{1}{[S]}$.

$$y_{\text{int}} = \frac{1}{V_{\max}} = 8.32 \times 10^5 \frac{\text{s}}{\text{M}}$$

$$V_{\max} = 1.20 \times 10^{-6} \frac{\text{M}}{\text{s}}$$

$$\text{slope} = \frac{K_M}{V_{\max}} = 389.5 \text{ s}$$

$$K_M = 4.68 \times 10^{-4} \text{ M}$$

Linear regression gives:

Figure 3.2

Problem 3.3

3.3 a)

Apparent chlorination rate:

$$\frac{-d[\text{C}_6\text{H}_5\text{OH}]_T}{dt} = k^* [\text{C}_6\text{H}_5\text{OH}]_T [\text{HOCl}]_T \quad (1)$$

Actual rate law:

$$\frac{-d[\text{C}_6\text{H}_5\text{O}^-]}{dt} = k [\text{C}_6\text{H}_5\text{O}^-] [\text{HOCl}] \quad (2)$$

Assuming pseudo-equilibrium for acid-base reactions:

$$\frac{-d[\text{C}_6\text{H}_5\text{O}^-]}{dt} = \frac{-d[\text{C}_6\text{H}_5\text{OH}]_T}{dt} \quad (3)$$

Thus

$$\frac{-d[\text{C}_6\text{H}_5\text{OH}]_T}{dt} = k [\text{C}_6\text{H}_5\text{O}^-] [\text{HOCl}] \quad (4)$$

and from Mass Laws

$$\frac{[\text{C}_6\text{H}_5\text{O}^-][\text{H}^+]}{[\text{C}_6\text{H}_5\text{OH}]} = K_{\text{ph}}$$

$$\frac{[\text{OCl}^-][\text{H}^+]}{[\text{HOCl}]} = K_{\text{HOCl}}$$

Write expressions for $[\text{C}_6\text{H}_5\text{O}^-]$ and $[\text{HOCl}]$ in terms of $[\text{C}_6\text{H}_5\text{OH}]_T$ and $[\text{HOCl}]_T$:

$$[\text{C}_6\text{H}_5\text{OH}]_T = [\text{C}_6\text{H}_5\text{O}^-] \left(1 + \frac{[\text{H}^+]}{K_{\text{ph}}} \right) \quad (5)$$

$$[\text{HOCl}]_T = [\text{HOCl}] \left(1 + \frac{K_{\text{HOCl}}}{[\text{H}^+]} \right) \quad (6)$$

Substitute (5) and (6) into (4):

$$\frac{-d[\text{C}_6\text{H}_5\text{OH}]_T}{dt} = \frac{k [\text{C}_6\text{H}_5\text{OH}]_T [\text{HOCl}]_T}{\left(1 + \frac{[\text{H}^+]}{K_{\text{HOCl}}} \right) \left(1 + \frac{K_{\text{ph}}}{[\text{H}^+]} \right)} \quad (7)$$

By comparison of (7) and (1):

$$k^* = \frac{k}{\left(1 + \frac{[\text{H}^+]}{K_{\text{ph}}} \right) \left(1 + \frac{K_{\text{HOCl}}}{[\text{H}^+]} \right)} \quad (8)$$

3.3 b)

At low pH ($\text{pH} < \text{p}K_{\text{HOCl}} < \text{p}K_{\text{ph}}$)

$$\left(1 + \frac{K_{\text{HOCl}}}{[\text{H}^+]} \right) \approx 1$$

and $\left(1 + \frac{[\text{H}^+]}{K_{\text{ph}}} \right) \approx \frac{[\text{H}^+]}{K_{\text{ph}}}$

then $k^* = \frac{kK_{\text{ph}}}{[\text{H}^+]} \propto \frac{1}{[\text{H}^+]}$

thus k^* increases with increasing pH in this region.

At high pH ($\text{pH} > \text{p}K_{\text{ph}} > \text{p}K_{\text{HOCl}}$)

$$\left(1 + \frac{K_{\text{HOCl}}}{[\text{H}^+]}\right) \approx \frac{K_{\text{HOCl}}}{[\text{H}^+]}$$

and $\left(1 + \frac{[\text{H}^+]}{K_{\text{ph}}}\right) \approx 1$

then $k^* = \frac{k[\text{H}^+]}{K_{\text{HOCl}}} \propto [\text{H}^+]$

Thus k^* decreases with increasing pH in this region. k^* reaches a maximum value in the mid-pH region (see below).

3.3 c)

$$\text{Rate of chlorination} = \frac{k[\text{C}_6\text{H}_5\text{OH}]_T [\text{HOCl}]_T}{\left(1 + \frac{[\text{H}^+]}{K_{\text{ph}}}\right) \left(1 + \frac{K_{\text{HOCl}}}{[\text{H}^+]}\right)}$$

At a given $[\text{C}_6\text{H}_5\text{OH}]_T$ and $[\text{HOCl}]_T$,

$$\text{Rate} \propto \frac{1}{\left(1 + \frac{[\text{H}^+]}{K_{\text{ph}}}\right) \left(1 + \frac{K_{\text{HOCl}}}{[\text{H}^+]}\right)}$$

The rate is highest between $\text{pH} = 7.5$ and $\text{pH} = 10$, because it is dependent on the product of the concentrations of $\text{C}_6\text{H}_5\text{O}^-$ and HOCl . Outside of this range, the concentrations of one of the reactants is dropping off rapidly, resulting in a lower reaction rate.

3.3 d)

Rearranging (8):

$$k^* = \frac{kK_{\text{ph}}[\text{H}^+]}{([\text{H}^+] + K_{\text{ph}})([\text{H}^+] + K_{\text{HOCl}})}$$

solve for maximum k^* or maximum $\log k^*$.

$$\log k^* = \log kK_{\text{ph}} + \log[\text{H}^+] - \log([\text{H}^+] + K_{\text{ph}}) - \log([\text{H}^+] + K_{\text{HOCl}})$$

at maximum $\log k^*$, $\frac{d \log k^*}{d[\text{H}^+]} = 0$

$$\frac{d(\log k^*)}{d[\text{H}^+]} = \frac{1}{[\text{H}^+]} - \frac{1}{[\text{H}^+] + K_{\text{ph}}} - \frac{1}{[\text{H}^+] + K_{\text{HOCl}}} = 0$$

Rearranging

$$K_{\text{ph}}K_{\text{HOCl}} = [\text{H}^+]^2$$

This maximum k^* occurs at

$$[\text{H}^+] = \sqrt{10^{-10}10^{-7.5}} = 10^{-8.75}$$

or $\text{pH} = 8.75$
