Three key questions about land use & decarbonization

1. Should cities continue to expand? (or not)

2. What is the role of land use planning in shaping the energy use and climate impact of the built environment?

3. Who and how should land uses be decided? What framing?

Tomalty report on Toronto Greenbelt and mitigation

Greenbelt facts (page 8):

- “Close to 750,000 hectares (1.8 million acres) of countryside, the largest greenbelt in the world.”
- “An integrated band of mostly green countryside ... allows for more complete ecosystem habitats and continuous migration routes than do isolated parks.”
- ‘217,000 hectares (535,000 acres) of lakes, wetlands, river valleys and forests, providing habitat for over one third of Ontario’s species at risk’
- “Preserves space for locally accessible tourism, recreation, and outdoor activities.”
- “With over 7,000 farms, agriculture is the predominant land use in the Greenbelt, generating over $1.5 billion in total gross farm receipts annually.”

Carbon storage (page 17):

- 147 million tonnes of carbon dioxide equivalent (CO2e)
- “To put this quantity of carbon in perspective, this amounts to more than twice the total CO2e released each year in Ontario from transportation, the province's largest source of emissions.”

Sutton-Grier²⁵,²⁶, Bronson W. Griscom³

Limiting climate warming to <2°C requires increased mitigation efforts, including land stewardship, whose potential in the United States is poorly understood. We quantified the potential of natural climate solutions (NCS)—21 conservation, restoration, and improved land management interventions on natural and agricultural lands—to increase carbon storage and avoid greenhouse gas emissions in the United States. We found a maximum potential of 1.2 (0.9 to 1.6) Pg CO₂e year⁻¹, the equivalent of 21% of current net annual emissions of the United States. At current carbon market prices (USD 10 per Mg CO₂e), 299 Tg CO₂e year⁻¹ could be achieved. NCS would also provide air and water filtration, flood control, soil health, wildlife habitat, and climate resilience benefits.

Importance of land uses and land cover

Summary from ecological literature, conversations:

1. the total sequestration potential is currently uncertain
   - dynamics of sequestration are also uncertain

2. ‘natural’ or existing ecosystems are more efficient than restored ones

3. policy mechanisms may be wildly different for different ecosystems
   - farm preservation versus biodiversity protections
   - carbon storage may fit into different regimes

Q: What does this all imply for urban planning of cities? (So what?)

A: Controlling the spatial expansion of cities is crucial.
LAND USE IN THE UNITED STATES

Many aspects of decarbonization depend on land use

- electricity
  - solar, wind, nuclear, hydropower
  - transmission lines

- buildings
  - heating, cooling systems + pipes and wires
  - locations!
  - uses, value, historic preservation, occupancy

- transportation
  - roads, bridges, charging stations
  - locations!
  - transit, freight, air, shipping

- industry
  - factories
  - energy sources
  - supply chains
  - jobs!
Jurisdictions over land use and energy

In the US, most decisions about land use are made at the local level!

Local:
- land & property taxes
- zoning
- building codes
- urban planning
- infrastructure financing

Federal:
- National Environmental Policy Act of 1970
- federal land protections
  - ownership
  - restricted uses (recreation, conservation, biodiversity, etc.)

State:
- “little NEPAs”
- (some) regional growth plans
- utility commissions
- state legislation, constitutions (pre-emption)
Local fragmentation

Mancur Olson, *The Logic of Collective Action*, 1965
- really about the difficulty of collective action
- ‘free-rider’ problem:
  - things that would broadly benefit many may be opposed by a concentrated minority
  - if the many are not sufficiently motivated, then the few win

Elinor Ostrom, *Governing the Commons*, 1990
- common pool resources can be preserved by collective action & goals
  - institutions
  - norms
  - enforcement mechanisms (formal and informal)
- “governance”
Will Local Politics Cook the Planet?

By Jonathan Chait

One of the more depressing lead sentences I have ever read in a news story was published on January 11. “A temporary moratorium on developing large-scale, ground-mounted solar projects, defined as ones that generate at least 250 kilowatts of power, is winning support from residents,” begins the article. From there, the report only gets worse. The
The Solar Farm That Almost Destroyed Copake, N.Y.

Residents of a small upstate town were bitterly divided over a planned development — until they weren’t.

By Francis Wilkinson
March 20, 2022 at 8:00 AM EDT
Debbie Dooley article

On a different area – solar subsidies and connections to the grid – but questions about the relationship between individuals, government, and technology.

Many positive articles from national publications about her effectiveness as a conservative activist for solar power, with fundamentally different motivations.
“Permitting reform”

Key questions to ask:

1. Are we talking about specific legislative language?
2. Will this change the speed of current permitting?
   - Is there sufficient administrative capacity?
   - Will this result in more or less litigation?
3. Will this change the amount of public participation?
4. Is this leading to the desired outcomes?
   - Is this necessary to build renewable resources? (Affordable housing?)
   - Is this necessary to build or block fossil fuel resources?
5. Could this get the necessary votes in the House and Senate?
Class discussion

Be prepared to discuss your p-set answers at length:

1. what city are you interested in learning more about its energy system?
2. what aspects of the built environment and land use affect your city’s energy system?
3. what did you read?
4. what areas do you feel that you don’t have enough information about your city or these aspects yet?
5. what additional questions do you have about the built environment, land use, and decarbonization after the readings, p-set, and video lecture?
Thank you!
