The Medium Run

¹These slides are NOT a substitute for chapters 6 to 9 of the book. They are meant to give you a more coincise and analytical presentation of the the Medium Run Model but many aspects of the model that are discussed in the book are not in these slides, and we shall assume you have read the book.

The Short Run

Output determination in the Short Run

(D is Demand, P is the price of Y)

How bad is the assumption that prices don't move? Not too bad in the short run: 4 to 6 quarters.

14.02 Notes ()

-

The Medium Run

- Think about what happens when firms respond to an increase in demand by increasing production
- Higher production will lead to higher employment
- Higher employment will lead to lower unemployment
- Lower unemployment will lead to higher wages
- Higher wages will increase production costs, leading firms to raise prices
- Higher prices will lead workers to ask for higher wages
- Higher wages will lead to further increases in prices
- and so on ...
- So far we assumed P=1
- We now move away from this assumption
- To understand how the sequence of events described above happens we need to undertsand
 - \blacktriangleright how the labor market works: employm \longrightarrow unempl \longrightarrow wages
 - how firms set prices given production costs

The Medium Run

March 17, 2014 4 / 18

Population, Labor force, Employment and Unemployment in the US (2010)

Population: 308.7 million

- Non institutionalized civilian population: 237.8 million
 - Out of the labor force: 84.0 million
 - Civilian labor force: 153.8 million
 - ★ Employment: 139 million
 - ★ Unemployed: 14.8 million

Labor market flows: measurement

- The Current Population Survey (CPS), is a monthly sample survey of approximately 60,000 households.
- Each month, the CPS is administered to about 40.000 households that were also in the survey during the previous month.
- The other 20.000 consists of new households

The month-to-month overlap allows the Bureau of Labor Statistics to track individuals who change labor force status from one month to the next

	Status in		
Status in prior month	Employed	Unemployed	Not in labor force
Employed	EE	EU	EN
Unemployed	UE	UU	UN
Not in the labor force	NE	NU	NN

How are wages and prices set

• wage setting

 $W = P^e F(u, z)$

Let's assume for the time being $P^e=P$, so that dividing by P we get the real wage W/P

$$\frac{W}{P}=F(u,z), \quad F_u<0, \quad F_z>0$$

• price setting: start from the production fct assuming only one factor, N and constant returns to scale, so that marginal cost is W

$$Y = N$$
$$P = (1 + m)W$$
$$\frac{W}{P} = \frac{1}{1 + m}$$

14.02 Notes ()

Wages, prices and the "natural" rate of unemployment

March 17, 2014 14 / 18

An increase in the generosity of unemployment benefits

Higher competition (lower mark-ups) reduce the natural rate of u

March 17, 2014 16 / 18

Model 3: a macroeconomic model of the Medium Run

- Aggregate supply (for given P^e)
 - wage determination

$$W = P^e F(u, z)$$

price determination

$$P = (1+m)W$$

$$P = P^e(1+m)F(u,z)$$

• Going from u to Y

$$u = \frac{U}{L} = \frac{L - N}{L} = 1 - \frac{N}{L} = 1 - \frac{Y}{L}$$

• Price setting (for given P^e)

$$P = P^{e}(1+m)F(1-\frac{Y}{L},z)$$

Model 3: a macroeconomic model of the Medium Run

• Aggregate demand

$$\frac{M}{P} = YL(i)$$
