

Problem S11 (Signals and Systems)

Consider an aircraft flying in cruise at 250 knots, so that

$$v_0 = 129 \text{ m/s}$$

Assume that the aircraft has lift-to-drag ratio

$$\frac{L_0}{D_0} = 15$$

Then the transfer function from changes in thrust to changes in altitude is

$$G(s) = \frac{2g}{mv_0} \frac{1}{s(s^2 + 2\zeta\omega_n s + \omega_n^2)} \quad (1)$$

where the *natural frequency* of the phugoid mode is

$$\omega_n = \sqrt{2} \frac{g}{v_0} \quad (2)$$

the *damping ratio* is

$$\zeta = \frac{1}{\sqrt{2}(L_0/D_0)} \quad (3)$$

and $g = 9.82 \text{ m/s}^2$ is the acceleration due to gravity. The transfer function can be normalized by the constant factor $\frac{2g}{mv_0}$, so that

$$\bar{G}(s) = \frac{1}{s(s^2 + 2\zeta\omega_n s + \omega_n^2)} \quad (4)$$

is the normalized transfer function, corresponding to normalized input

$$u(t) = \frac{2g}{mv_0} \delta T$$

1. Find and plot the impulse response corresponding to the transfer function $\bar{G}(s)$, using partial fraction expansion and inverse Laplace techniques. Hint: The poles of the system are complex, so you will have to do complex arithmetic.
2. Suppose we try to control the altitude through a feedback loop, as shown below

That is, the control input $u(t)$ (normalized throttle) is a gain k times the error, $e(t)$, which is the difference between the altitude $h(t)$ and the altitude reference $r(t)$. The transfer function from $r(t)$ to $h(t)$ can be shown to be

$$H(s) = \frac{1}{1 + kG(s)}$$

For the gain k in the range $[0, 0.1]$, plot the poles of the system in the complex plane. You should find that for any positive k , the complex poles are made less stable. What gain k makes the complex poles unstable, i.e., for what gain is the damping ratio zero?

3. For the gain k in the range $[-0.1, 0]$, plot the poles of the system in the complex plane. You should find that for any negative k , the real pole is unstable.

Note that neither positive gain or negative gain makes the system more stable than without feedback control. It is possible to do better with a dynamic gain, but this problem should give you an idea of why the phugoid dynamics are so hard to control with throttle only.
