# A Framework for Understanding Uncertainty and its Mitigation and Exploitation in Complex Systems

**Prof. Daniel Hastings - MIT**  
**Dr. Hugh McManus - Metis Design**

**Space Systems, Policy, and Architecture Research Consortium**  
**A joint venture of MIT, Stanford, Caltech & the Naval War College**  
**for the NRO**

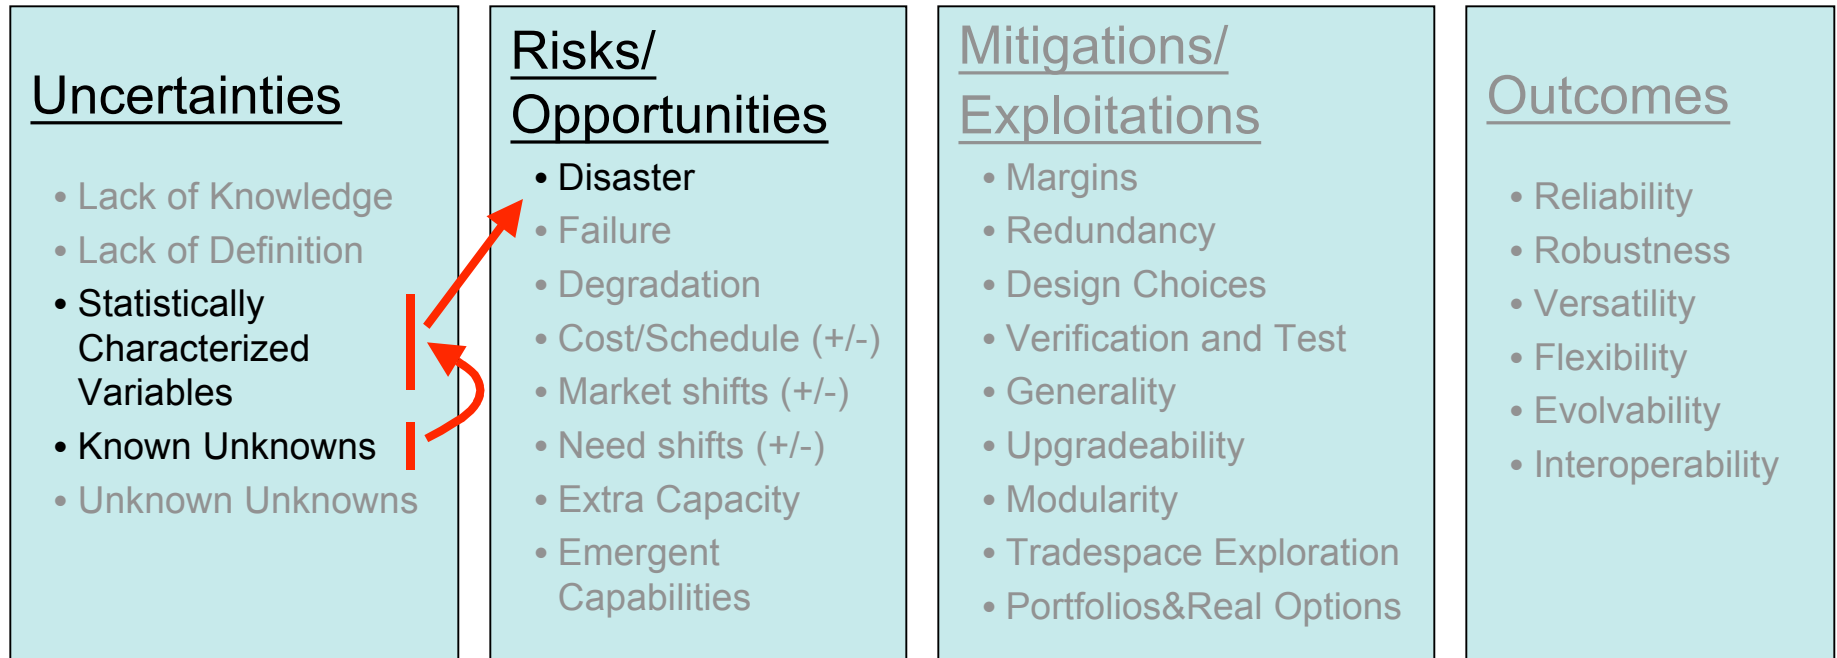

- Growing body of work on uncertainty
  - Conventional (technical) uncertainties
  - Market and strategic environment
  - Budget and policy decisions
  - Management and team dynamics
- New tools for handling them
  - Trade space analysis
  - Modularity
  - Real options and portfolio theory
- National awareness of need for advanced attributes
  - Robust, flexible, evolutionary systems called for
  - Confusion about what these terms mean

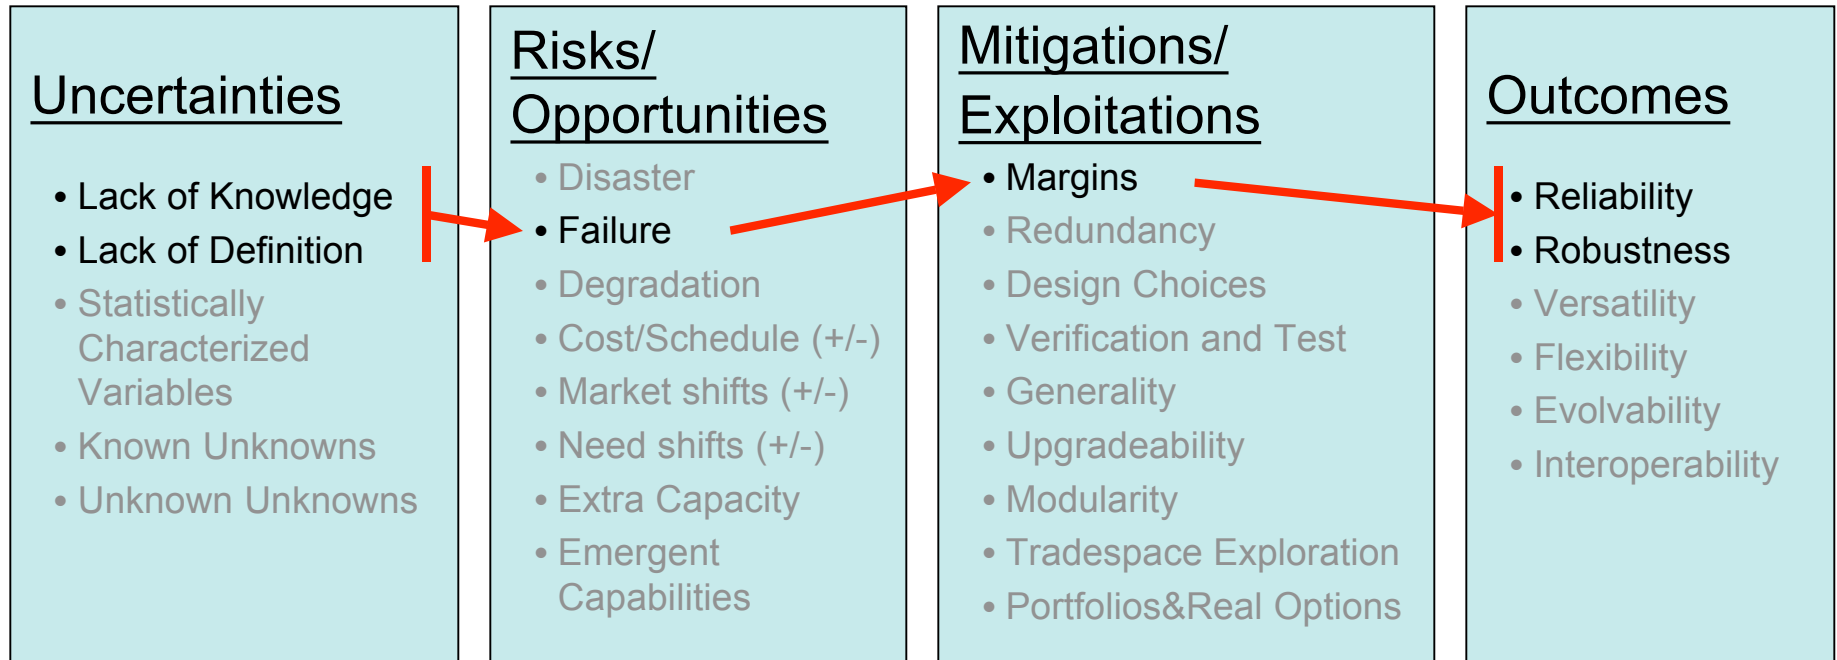

Need a unified look at these issues

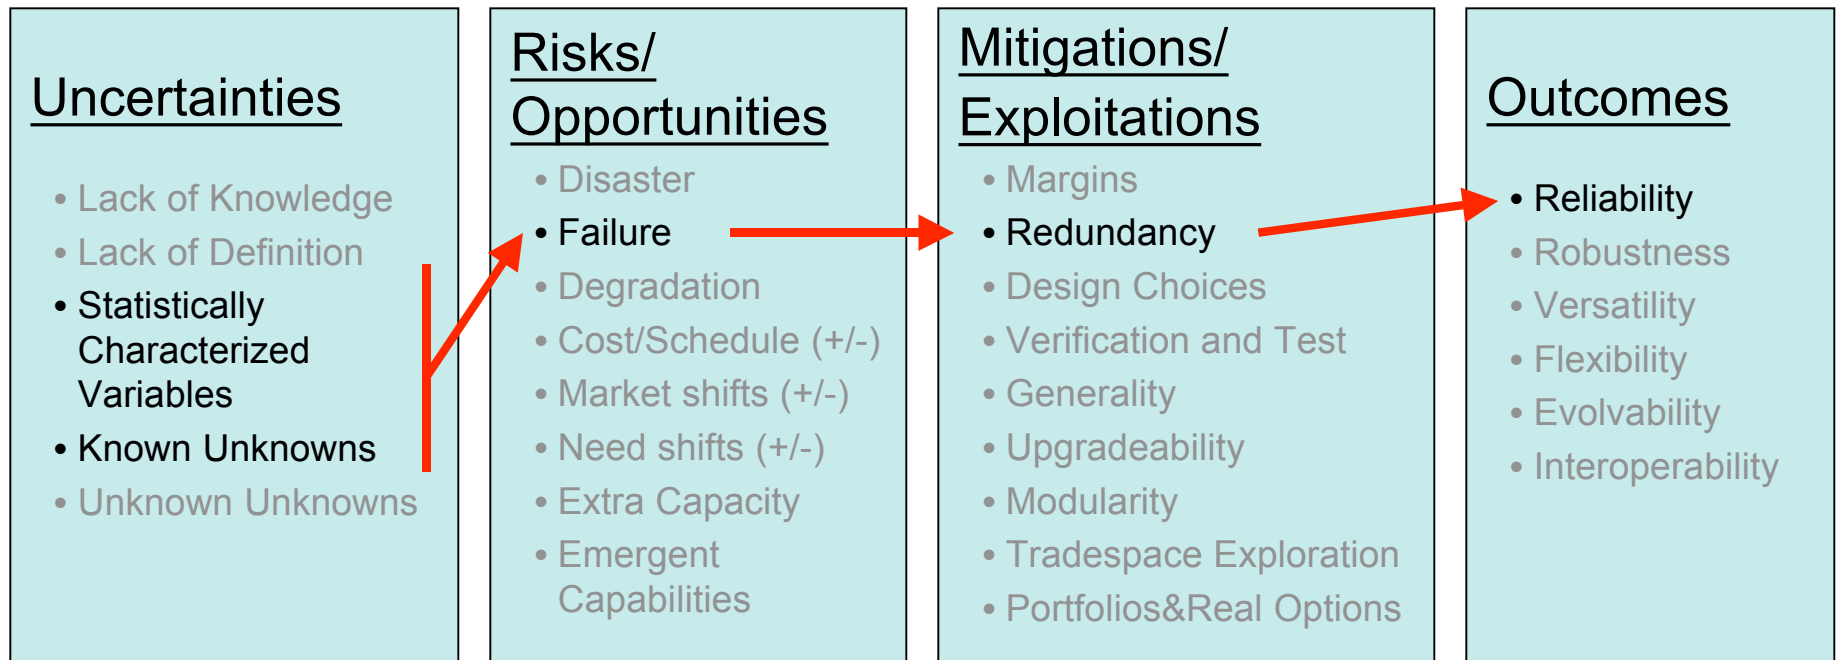

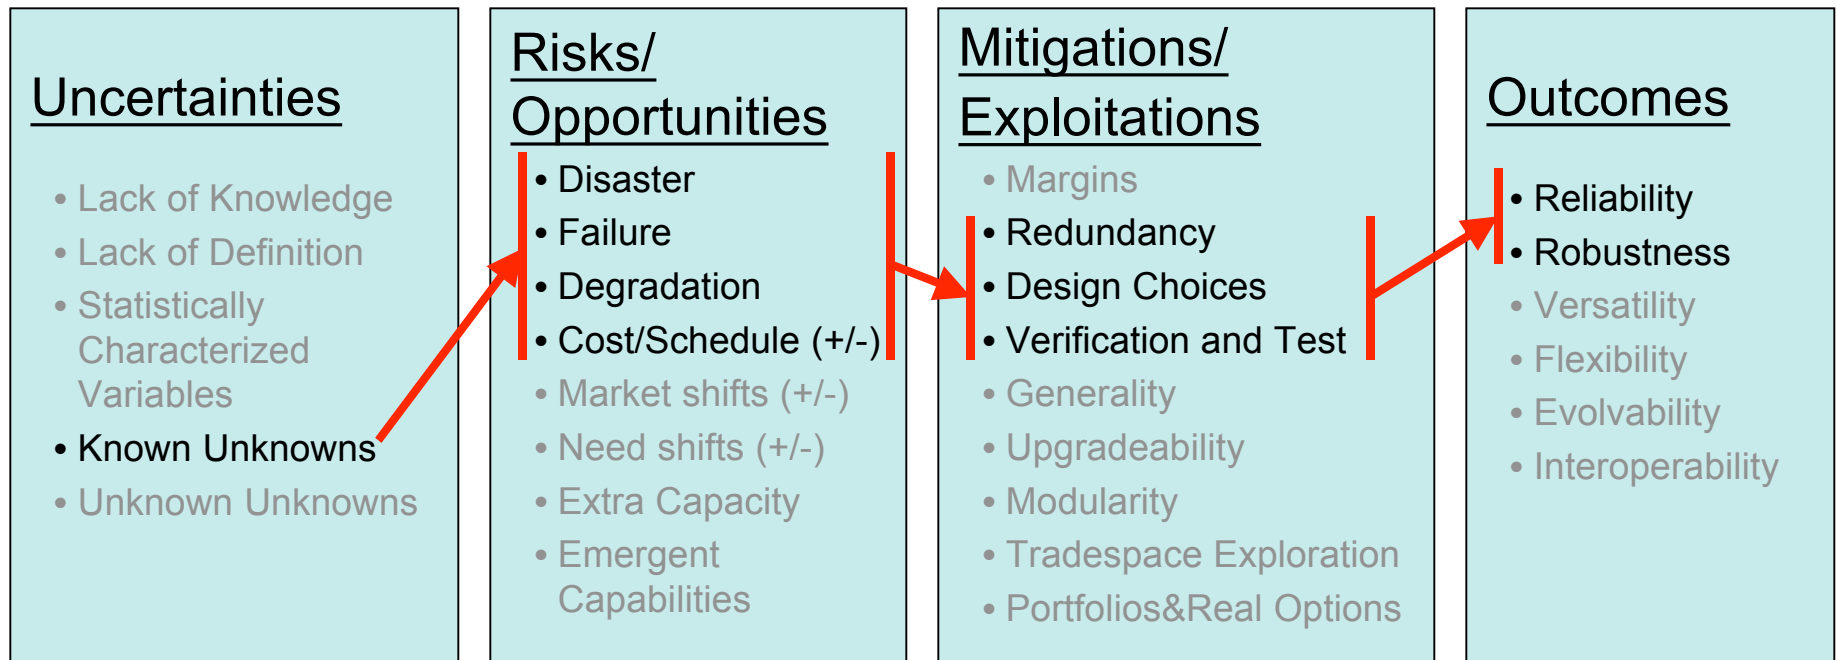

<Uncertainty> causes <Risk> handled by <Mitigation> resulting in <Outcome>

Four categories, from uncertainty in nature to resulting system  
Breakdown each into broad classes

A process for understanding complex solutions to complex problems

- Model-based high-level assessment of system capability
- Ideally, *many* architectures assessed
- Avoids optimized *point solutions* that will not support evolution in environment or user needs
- Provides a basis to explore technical and policy *uncertainties*
- Provides a way to assess the value of *potential* capabilities

Allows informed “upfront” decisions and planning

## *Emerging tools: Tradespace Exploration*

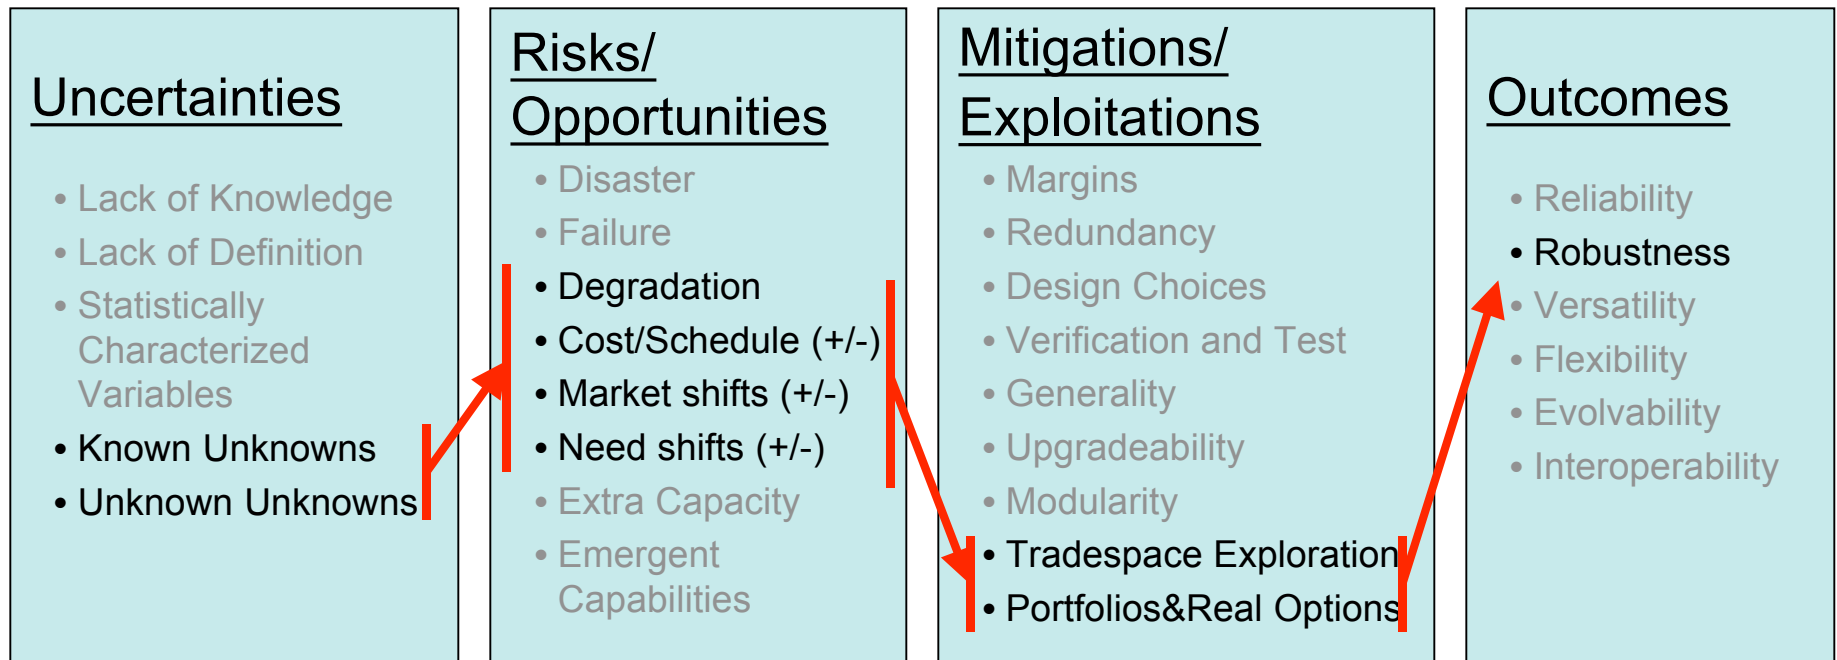

- Look at thousands of architectures with simulation models
- Often learn a lot by simple examination

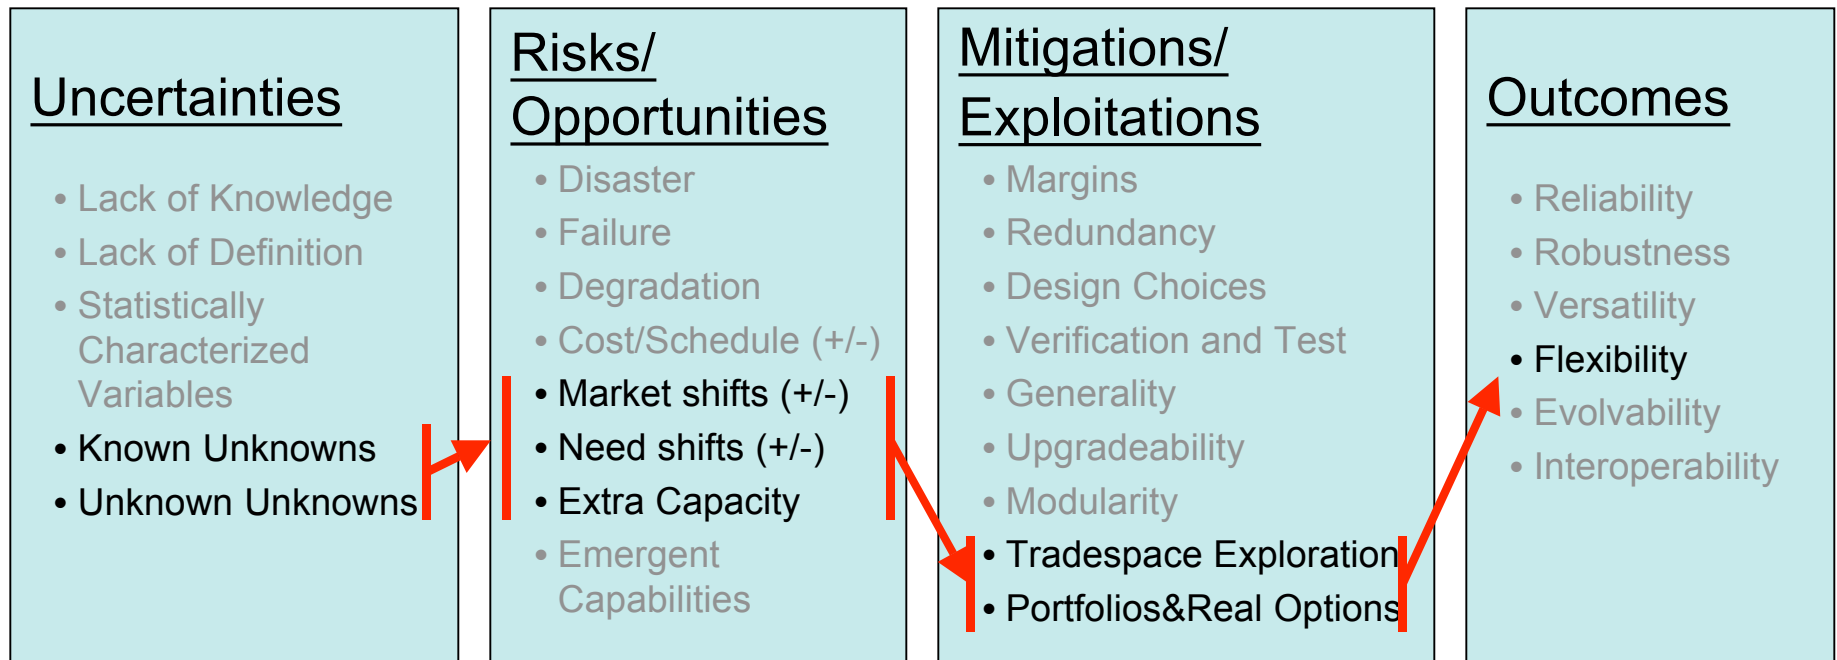

- *Explicitly* look at sensitivity of models to uncertainties
- Uncertainties can be market (shown), policy, or technical
- Mitigate with portfolio, real options methods

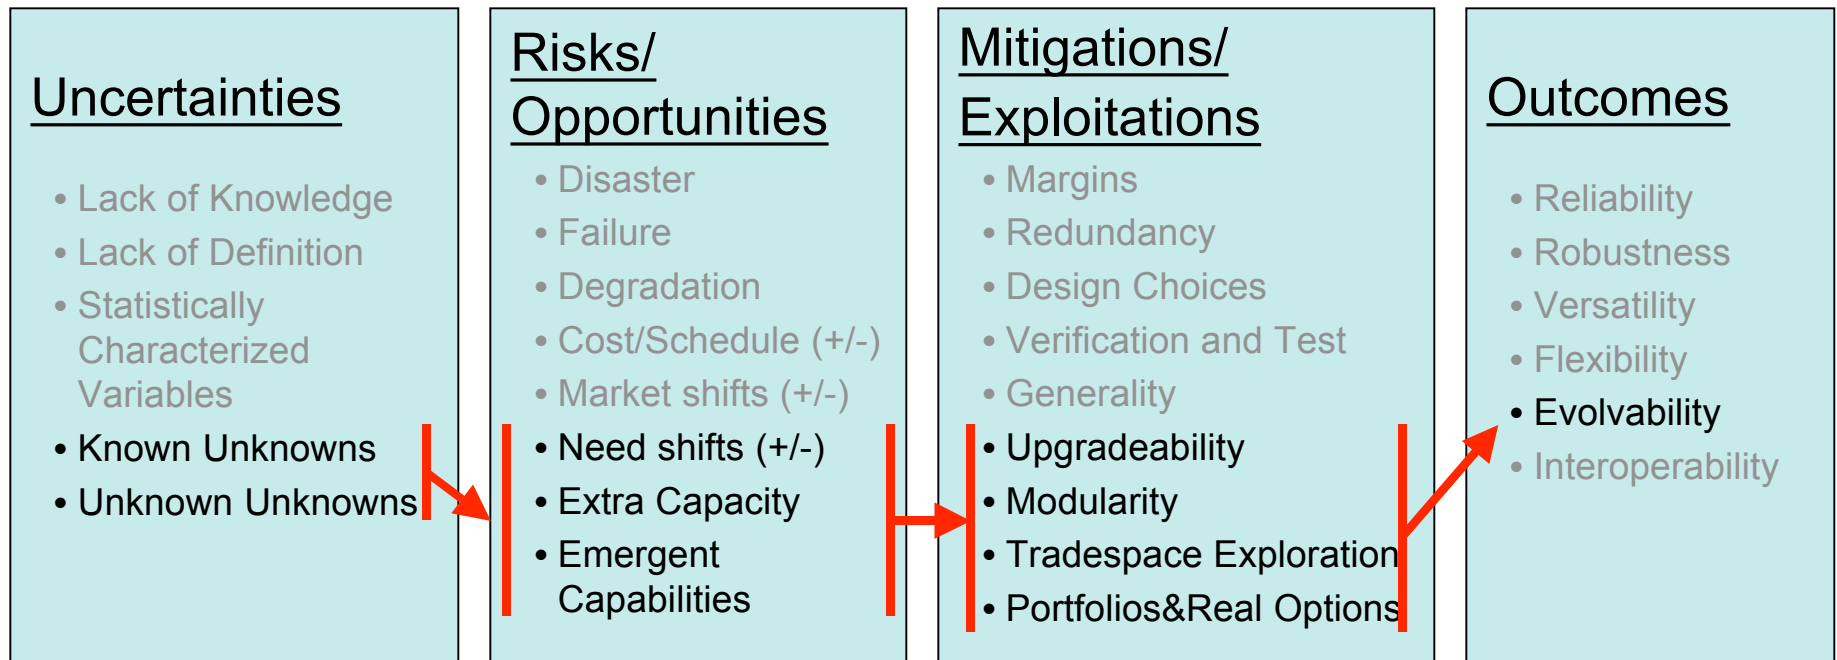

- **Reliability:** *Probability that the system will do the job it was asked to do (i.e. will work).*
- **Robustness:** *Ability of the system to do its basic job in unexpectedly adverse environments.*
- **Versatility:** *Ability of the system, as built/designed, to do jobs not originally included in the requirements definition, and/or or to do a variety of required jobs well.*
- **Flexibility:** *Ability of the system to be modified to do jobs not originally included in the requirements definition.*
- **Evolvability:** *Ability of the system to serve as the basis of new systems (or at least generations of the current system) to meet new needs and/or attain new capability levels.*

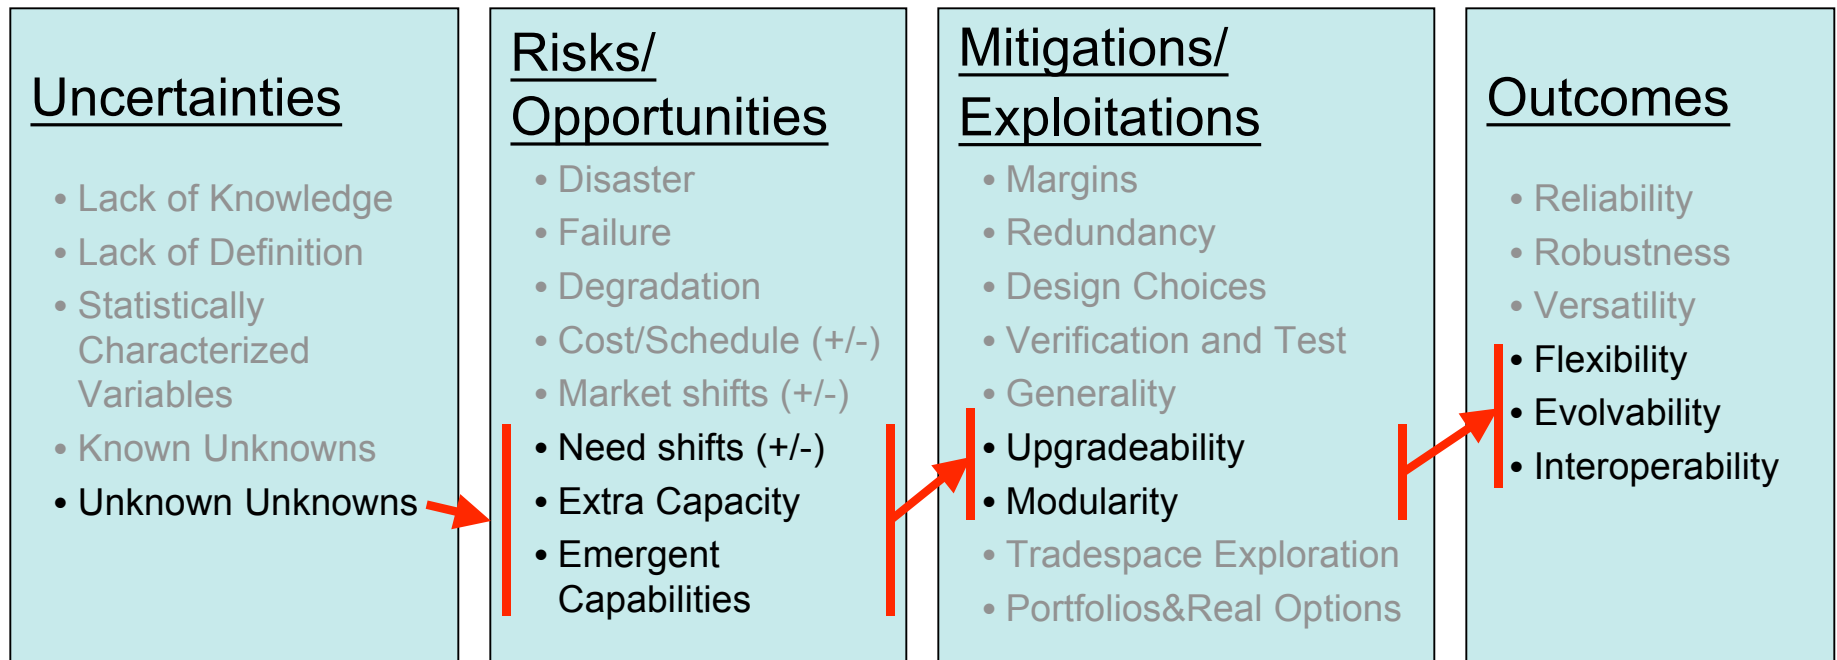

Much confusion in both terminology and real needs

# Living in an Uncertain World: Evolutionary Aquisition

- Framework puts a large number of problems, tools, and needs in context.
- Potential exists for systematically managing, mitigating and even exploiting most types of uncertainty
  - Mature methods and powerful tools occupy the upper (left) of the framework
  - Qualitative methods (e.g. risk management) occupy the center
  - The bottom (right) is covered by new methods
- As engineering systems expands to address new kinds of uncertainties and new desired system attributes, new methods must mature and enter general practice
