Continuous Expectation and Variance, Quantiles, the Law of Large Numbers 18.05 Spring 2022

## Agenda/Announcements

- Friday is a normal class in - we'll finish class 6
- In case of a snow closing, we will cancel class and adjust the pset and schedule.
- R studio graded:
- Good job!
- Notice that we are learning how easy simulations are to do
- -0.25 for stray printouts -this will go up as time goes on
- Gabriel has OH after class.

## Agenda

- Expected value
- Variance and standard deviation
- Quantiles (median etc.)
- Histograms
- Law of Large Numbers (LoLN)
- Tomorrow: Central Limit Theorem (CLT)

## Expected value

Expected value: measure of location, central tendency
Definition. $X$ continuous with range $[a, b]$ and $\mathrm{pdf} f(x)$ :

$$
E[X]=\int_{a}^{b} x f(x) d x
$$

$X$ discrete with values $x_{1}, \ldots, x_{n}$ and $\operatorname{pmf} p\left(x_{i}\right)$ :

$$
E[X]=\sum_{i=1}^{n} x_{i} p\left(x_{i}\right) .
$$

Continuous and discrete expectation are essentially the same formulas.

## Variance and standard deviation

Standard deviation: measure of spread, scale
Definition. For any random variable $X$ with mean $\mu$,

$$
\operatorname{Var}(X)=E\left[(X-\mu)^{2}\right], \quad \sigma=\sqrt{\operatorname{Var}(X)}
$$

$X$ continuous with range $[a, b]$ and pdf $f(x)$ :

$$
\operatorname{Var}(X)=\int_{a}^{b}(x-\mu)^{2} f(x) d x
$$

$X$ discrete with values $x_{1}, \ldots, x_{n}$ and $\mathrm{pmf} p\left(x_{i}\right)$ :

$$
\operatorname{Var}(X)=\sum_{i=1}^{n}\left(x_{i}-\mu\right)^{2} p\left(x_{i}\right) .
$$

Continuous and discrete variance are essentially the same formulas.

## Properties

Properties: (the same for discrete and continuous)

1. $E[X+Y]=E[X]+E[Y]$.
2. $E[a X+b]=a E[X]+b$.
3. If $X$ and $Y$ are independent then
$\operatorname{Var}(X+Y)=\operatorname{Var}(X)+\operatorname{Var}(Y)$.
4. $\operatorname{Var}(a X+b)=a^{2} \operatorname{Var}(X)$.
5. $\operatorname{Var}(X)=E\left[X^{2}\right]-E[X]^{2}$.

## Board question

The random variable $X$ has range $[0,1]$ and $\mathrm{pdf} f(x)=c x^{2}$.
(a) Find $c$.
(b) Find the mean, variance and standard deviation of $X$.
(c) Find the median value of $X$.
(d) Suppose $X_{1}, \ldots X_{16}$ are independent identically-distributed copies of $X$. Let $\bar{X}$ be their average. What is the standard deviation of $\bar{X}$ ?
(e) Suppose $Y=X^{4}$. Compute $E[Y]$
(f) Find the pdf of $Y$.

## Quantiles: measure of location

Example. The 0.6 quantile $q_{0.6}$ is the $x$-value, with $P\left(X \leq q_{0.6}\right)=F\left(q_{0.6}\right)=0.6$.

$q_{0.6}$ : left tail area $=0.6 \Leftrightarrow F\left(q_{0.6}\right)=0.6 \Leftrightarrow q_{0.6}=F^{-1}(0.6)$
In R: qnorm, qbinom, qexp etc. The posted problems for today include one on using $R$ for quantiles.

## Concept questions: Greatest median 1

Each of the curves is the density for a random variable. Where there is just one curve they overlap.
The median of the black plot is at $q$. Which density has the greatest median?

1. Black
2. Orange
3. Blue
4. All the same 5. Impossible to tell

## Concept questions: Greatest median 2

Each of the curves is the density for a random variable. Where there is just one curve they overlap.
The median of the black plot is at $q$. Which density has the greatest median?

1. Black
2. Orange
3. Blue
4. All the same 5. Impossible to tell

## Histograms

Made by 'binning' data.
Frequency: height of bar over $\operatorname{bin}=$ number of data points in bin.

Density: area of bar $=$ fraction of all data points that lie in the bin. So, total area is 1.

## Example: equal bin widths

Consider data $0.5,0.9,1.0,1.3,1.4,1.5,1.8,1.8,2.0,2.0$. Make frequency and density histograms with bin width 0.5 starting at 0.0 .

Check that the total area of the histogram on the left is 1 .

- Values on bin boundaries, e.g. 0.5, 1, 1.5, 2 go to left-hand bin.
- Bins are right-closed, e.g first bin is $(0,0.5]$.
- With equal bin widths the histograms look the same. Only vertical scale is changed.

## Example: unequal bin widths

Repeat the example with unequal bin widths. Put the bin bounds at 0.0, 0.5, 1.5, 2.0.

Solution: With unequal bin widths the density and frequency histograms look different

Don't be fooled! These are based on the same data.

- If using unequal bin widths, always use a density histogram.
- R will complain if you don't
- Density histogram looks similar to previous histograms.
- Frequency histogram is different and misleading

## Board question: Histograms

(a) Make both a frequency and density histogram from the data below.

Use bins of width 0.5 starting at 0 . The bins should be right closed.

| 1 | 1.2 | 1.3 | 1.6 | 1.6 |
| :--- | :--- | :--- | :--- | :--- |
| 2.1 | 2.2 | 2.6 | 2.7 | 3.1 |
| 3.2 | 3.4 | 3.8 | 3.9 | 3.9 |

(b) Same question using unequal width bins with edges $0,1,3,4$.
(c) For part (b), why does the density histogram give a more reasonable representation of the data?

## Law of Large Numbers (LoLN)

- Informally: An average of many measurements is more accurate than a single measurement.
- Formally: Let $X_{1}, X_{2}$, ...be i.i.d. random variables all with mean $\mu$ and standard deviation $\sigma$.

$$
\bar{X}_{n}=\frac{X_{1}+X_{2}+\ldots+X_{n}}{n}=\frac{1}{n} \sum_{i=1}^{n} X_{i}
$$

Then for any (small number) $a$, we have

$$
\lim _{n \rightarrow \infty} P\left(\left|\bar{X}_{n}-\mu\right|<a\right)=1
$$

- By choosing $n$ large enough we can, with probability close to 1 , make $\bar{X}_{n}$ as close as we want to $\mu$.
$\bar{X}_{n}$ is random, so there may be a small probability that it is far from $\mu$.

## Concept Question: Desperation

- You have $\$ 100$. You need $\$ 1000$ by tomorrow morning.
- Your only way to get it is to gamble.
- If you bet $\$ \mathrm{k}$, you either win $\$ \mathrm{k}$ with probability $p$ or lose $\$ \mathrm{k}$ with probability $1-p$.

Maximal strategy: Bet as much as you can, up to what you need, each time.
Minimal strategy: Make a small bet, say \$5, each time.
(a) If $p=0.45$, which is the better strategy?
(a) Maximal
(b) Minimal
(c) They are the same

## Concept Question: Desperation

- Your only way to get it is to gamble.
- If you bet $\$ \mathrm{k}$, you either win $\$ \mathrm{k}$ with probability $p$ or lose $\$ \mathrm{k}$ with probability $1-p$.

Maximal strategy: Bet as much as you can, up to what you need, each time.
Minimal strategy: Make a small bet, say \$5, each time.
(a) If $p=0.45$, which is the better strategy?
(a) Maximal
(b) Minimal
(c) They are the same
(b) If $p=0.8$, which is the better strategy?
(a) Maximal
(b) Minimal
(c) They are the same

## LoLN and histograms

LoLN implies density histogram converges to pdf:

Histogram with bin width 0.1 showing 100000 draws from a standard normal distribution. Standard normal pdf is overlaid in blue.
