Lecture 05 2009 09 23 WED

TOPICS: Domains of influence and dependence.  
Causality and uniqueness. Allowed boundary conditions.  
Examples.

Domain of definition and domain of dependence: where is the solution defined.

Implications for where conditions must be given:

$u_t + c(x)u_x = 0$  in an interval  $a < x < b$ .

Causality:

If  $c(a) > 0$ , BC's needed at  $x = a$ , and only then.

If  $c(b) < 0$ , BC's needed at  $x = b$ , and only then.

Draw characteristics for various example  $c = c(x)$ .

Generalize method of characteristics to other first order scalar eqn.:

--- Semilinear.

--- Quasilinear.

Domain of definition of solution does not depend on data for linear.

Semilinear

Do example:  $xu_x + yu_y = u^2$ , with  $u(x, 1) = F(x)$

Domain of definition depends on  $F$  [solution blows up along characteristics when  $F$  not zero].

Do example  $u_t + cu_x = u^2$ , with  $u(x, 0) = F(x)$ .

Solution not defined for all  $t > 0$  along characteristics where  $F > 0$ .

Quasilinear

Characteristics may cross, leading to multiple values.

Start with  $u_t + c(u)u_x = 0$  and  $u(x, 0) = F(x)$ .

Solutions by characteristics.

Implicit form of the solutions.

Crossing of characteristics.
