Thus the heat is “recycled” within the system. Energy efficiency is a function of the number of effects.

## MED desalination plant

### Typical stage arrangement of a large MED plant

Courtesy of Corrado Sommariva. Used with permission.

# Multi-Effect Distillation (MED)

Raw seawater total dissolved solids  
(TDS): 35-47,000 mg/L

Top brine temperature: 63-75° C

Performance ratio: 12

Electrical power: 2 kWh/m<sup>3</sup>

Scale inhibitors used for scale control

Dual purpose plant

Unit size reached 8 MIGD in Sharjah,  
new design for unit sizes 10-15 MIGD

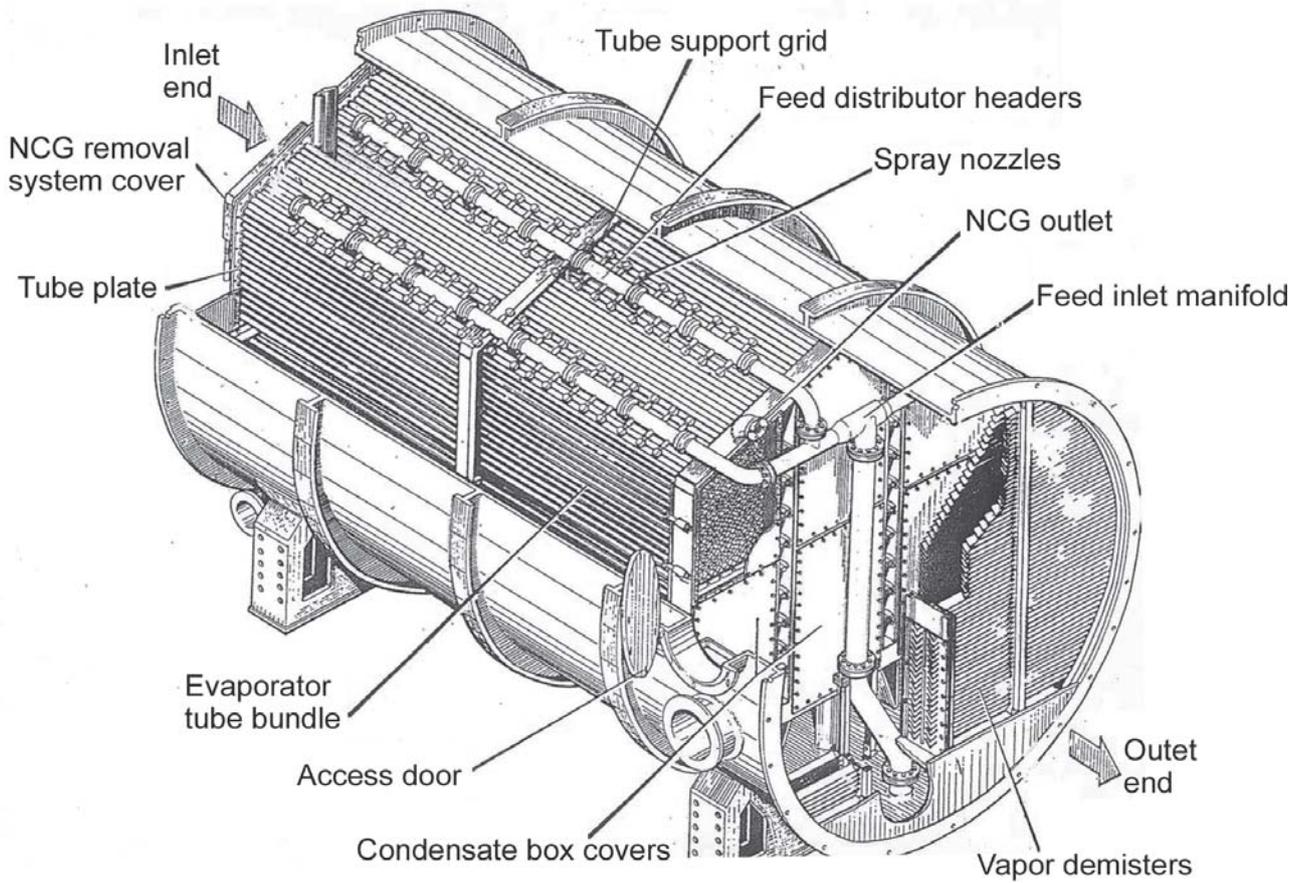

Courtesy of Leon Awerbuch. Used with permission.

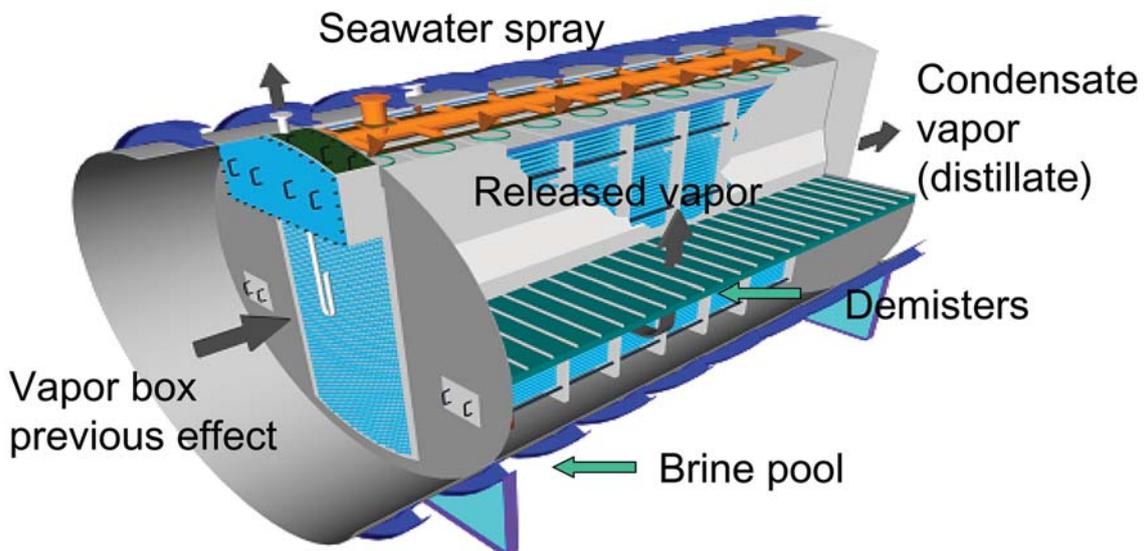

*LET Proprietary*

# One of more efficient MED plants with Performance Ratio of 12 in Las Palmas

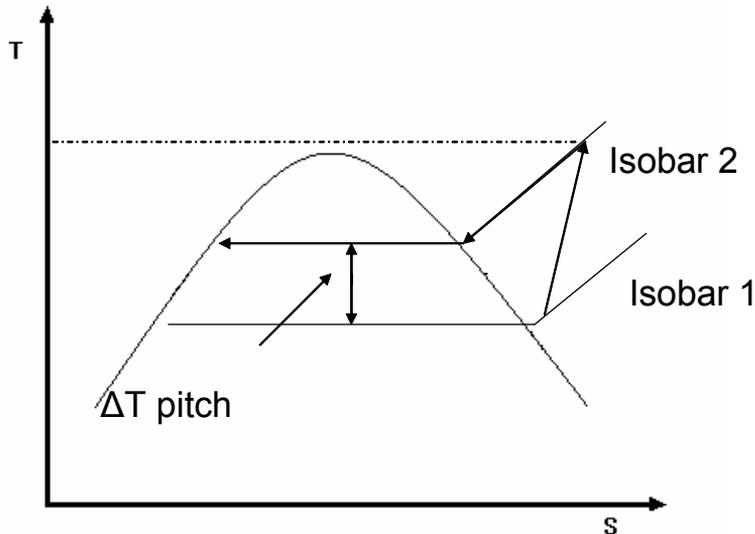

PLANTA LAS PALMAS TELDE (GRAN CANARIA)

## The concept of thermo compression

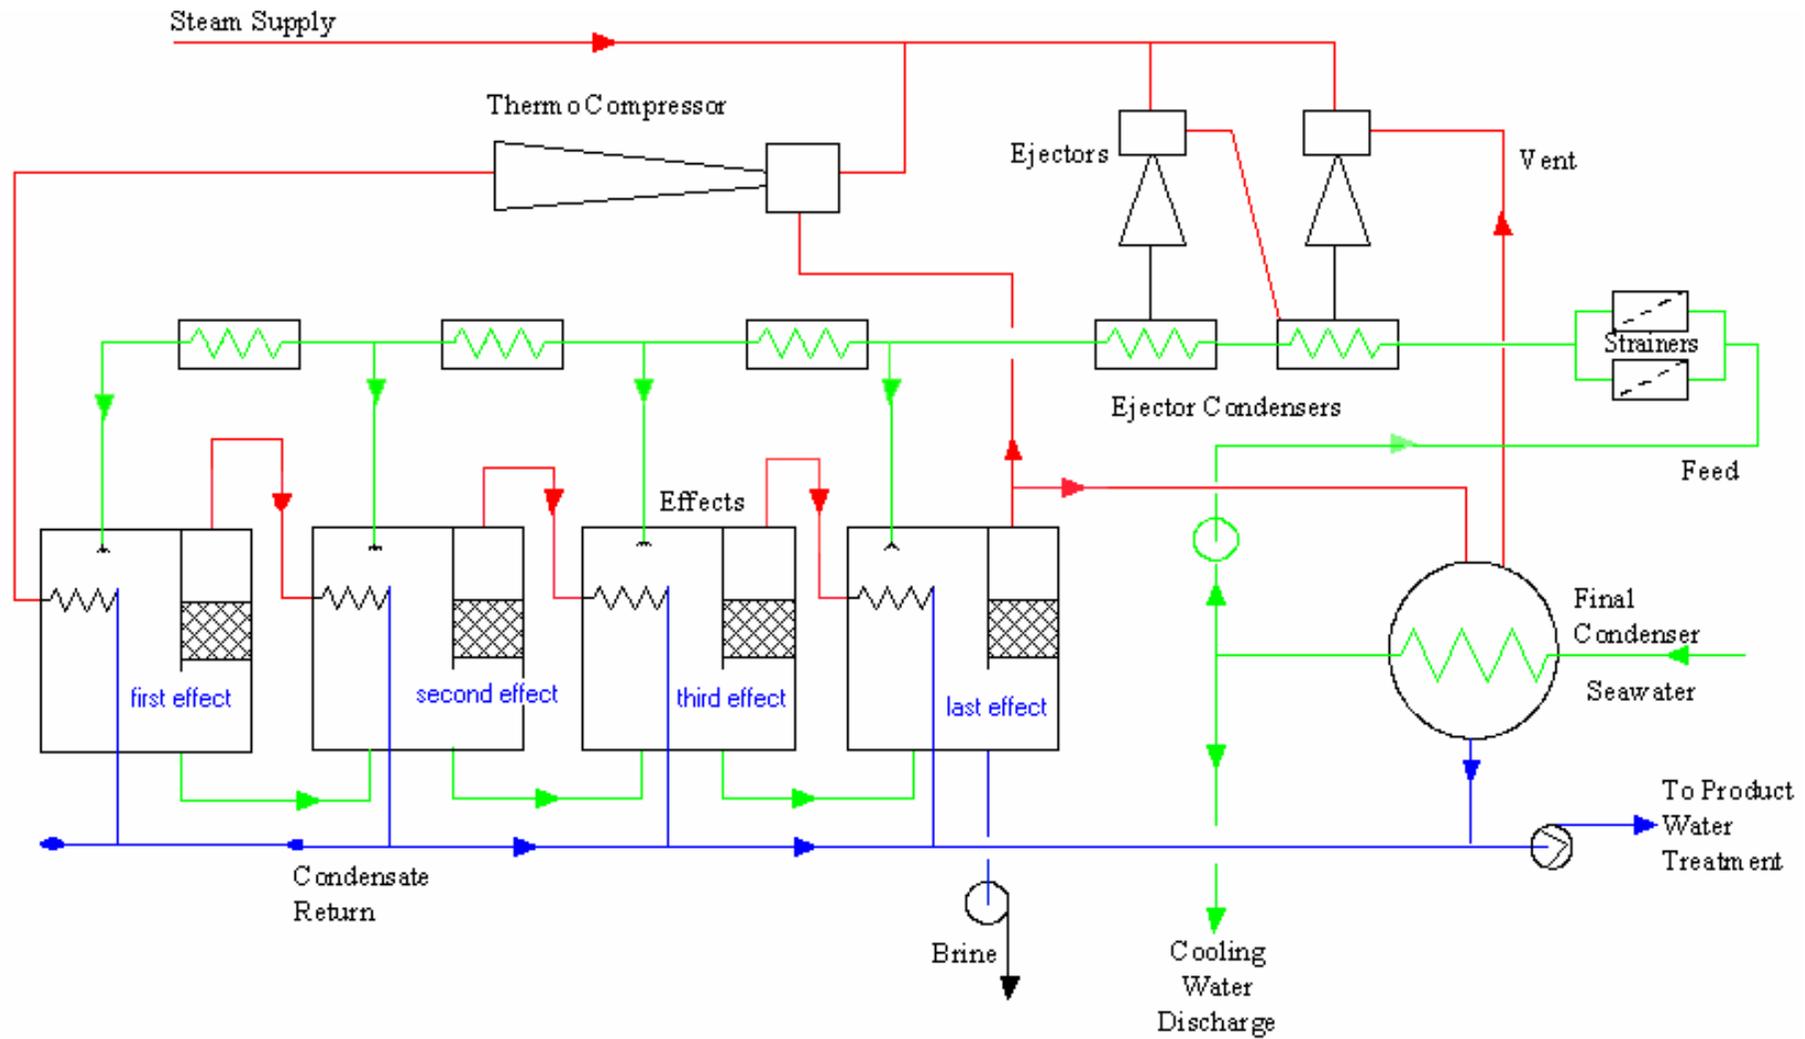

If reduced pressure causes evaporation at a lower temperature, then compression should force condensation at a higher temperature.

The combination of these phenomena can yield useful (and efficient) desalination process.

Fluid flowing in the pipeline (the “motive fluid”) speeds up to pass through the restriction and in accordance with Bernoulli’s equation creates vacuum in the restriction.

A side port at the restriction allows the vacuum to draw a second fluid (the “ejected”) into the motive fluid through the port.

Turbulence downstream of the port entrains and mixes the ejected into the motive fluid.

Schematic of multiple effect evaporation with vapor compression (A) parallel feed thermal vapor compression, (MEE-P/TVC) and (B) parallel feed mechanical vapor compression, (MEE-P/MVC).

Figure by MIT OpenCourseWare. Adapted from Fig. 1 in El-Dessouky, H. T., and H. M. Ettouney. "Multiple Effect Evaporation - Vapor Compression." Chapter 5 in *Fundamentals of Salt Water Desalination*. New York, NY: Elsevier, 2002.

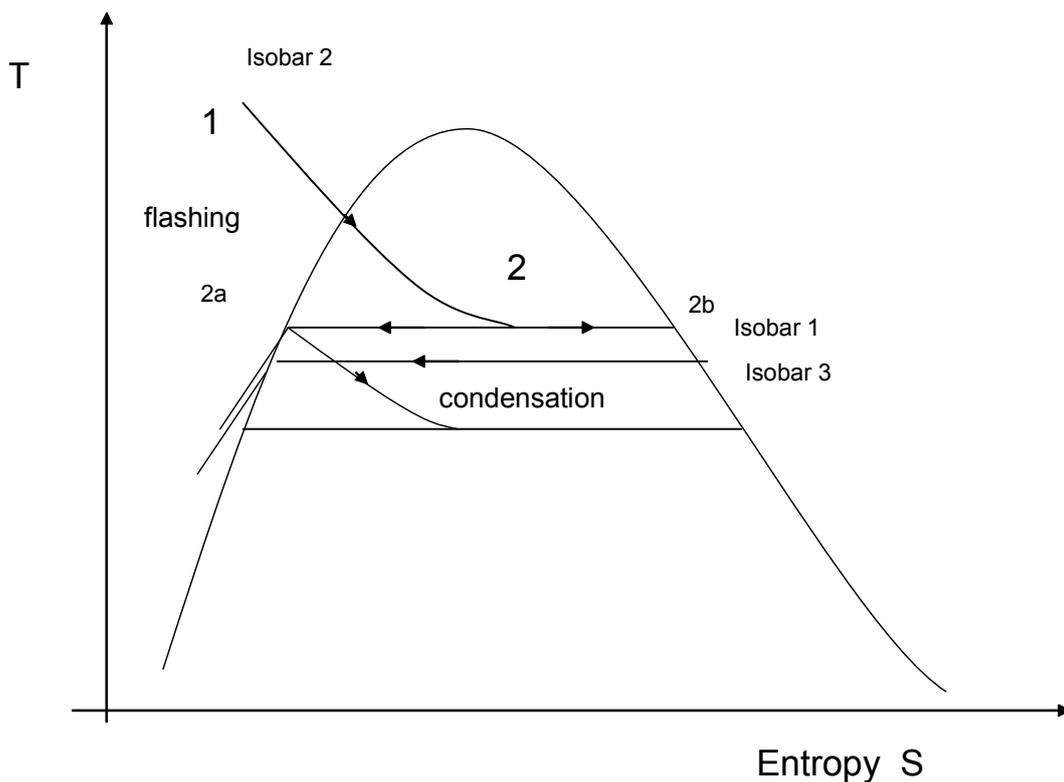

## MSF desalination plant

### Typical stage arrangement of a large MSF plant

Courtesy of Corrado Sommariva. Used with permission.

### Stage modeling thermodynamic ideal case

Courtesy of Corrado Sommariva. Used with permission.

## Process description: How did it begin?

- It had long been known that water could be heated above its normal boiling point in a pressurized system.
- If the pressure was released, a portion of the water would boil off or “flash”. The remaining liquid water would be cooled as the issuing vapor took with it its heat of vaporization.
- Since evaporation occurred from the bulk fluid rather than at a hot heat exchange surface, opportunities for scaling would be reduced.

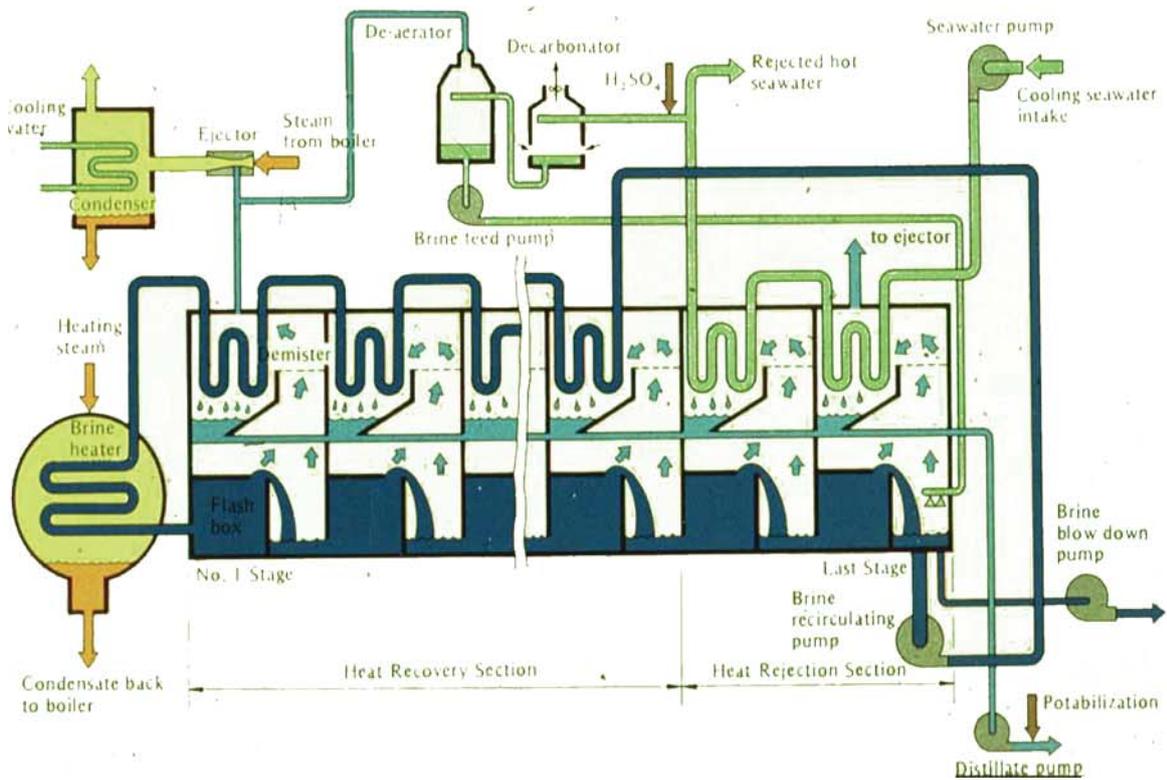

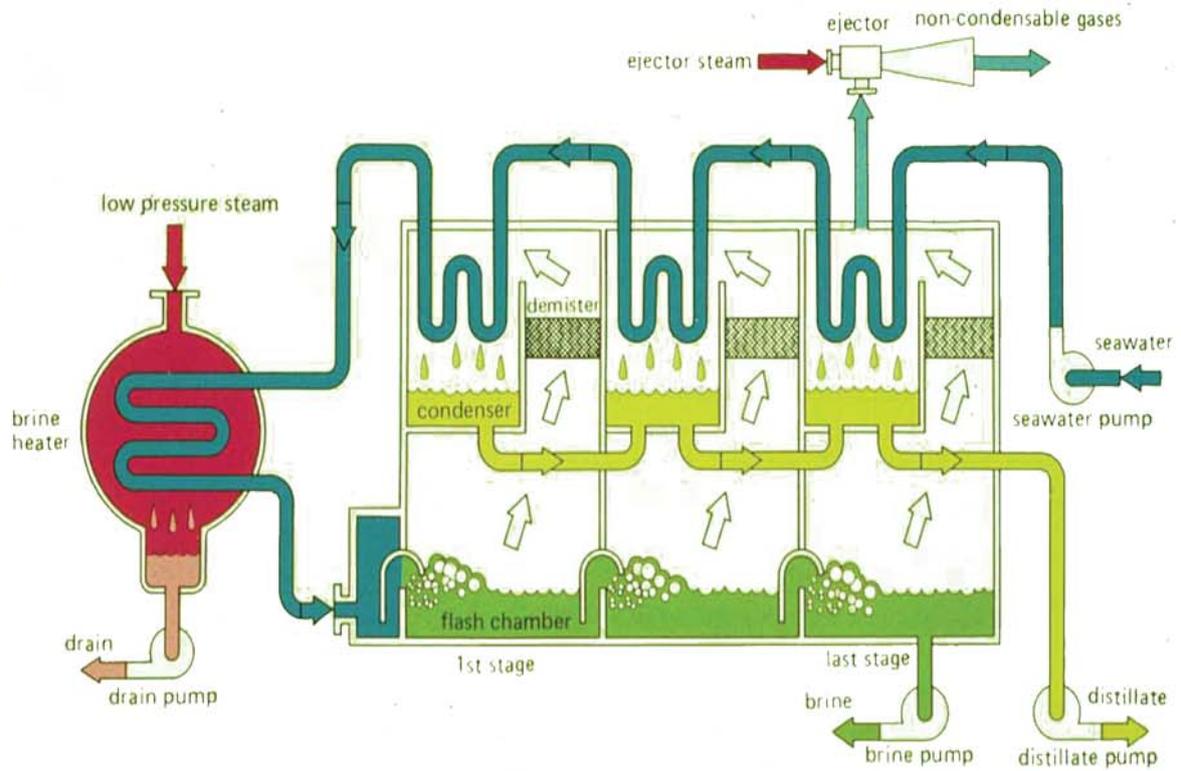

## What flashing looks like

- Hot brine from the previous stage enters through slot at lower temperature and pressure stage
- It senses the new lower pressure environment, and
- Flashes!

Courtesy of Corrado Sommariva. Used with permission.

### MSF desalination plant

### MSF what process?

# Improvements in distillation processes

**TOP BRINE TEMPERATURE : The Increase of TBT can Allow Higher Production With Almost Same Desal Trains**

**HYBRIDIZATION : The Application Of Hybrid Technologies (MSF + RO+NF, or MSF+RO+NF + MED) Can Improve Overall Efficiency**

**THERMAL IMPROVEMENT : Better HTC , new materials, New MSF+MED Schemes And Ancillary Equipment.**

Courtesy of Leon Awerbuch. Used with permission.

# Potential for MED technology improvements

- Increasing TBT from 63° C to 80-100° C with Nanofiltration
- Increase efficiency to PR 12-16 from current 9.
- Increase unit size to 15 MIGD from current 8 MIGD
- Improve HTC by oval and corrugated plates
- Hybridize with MSF-RO-NF

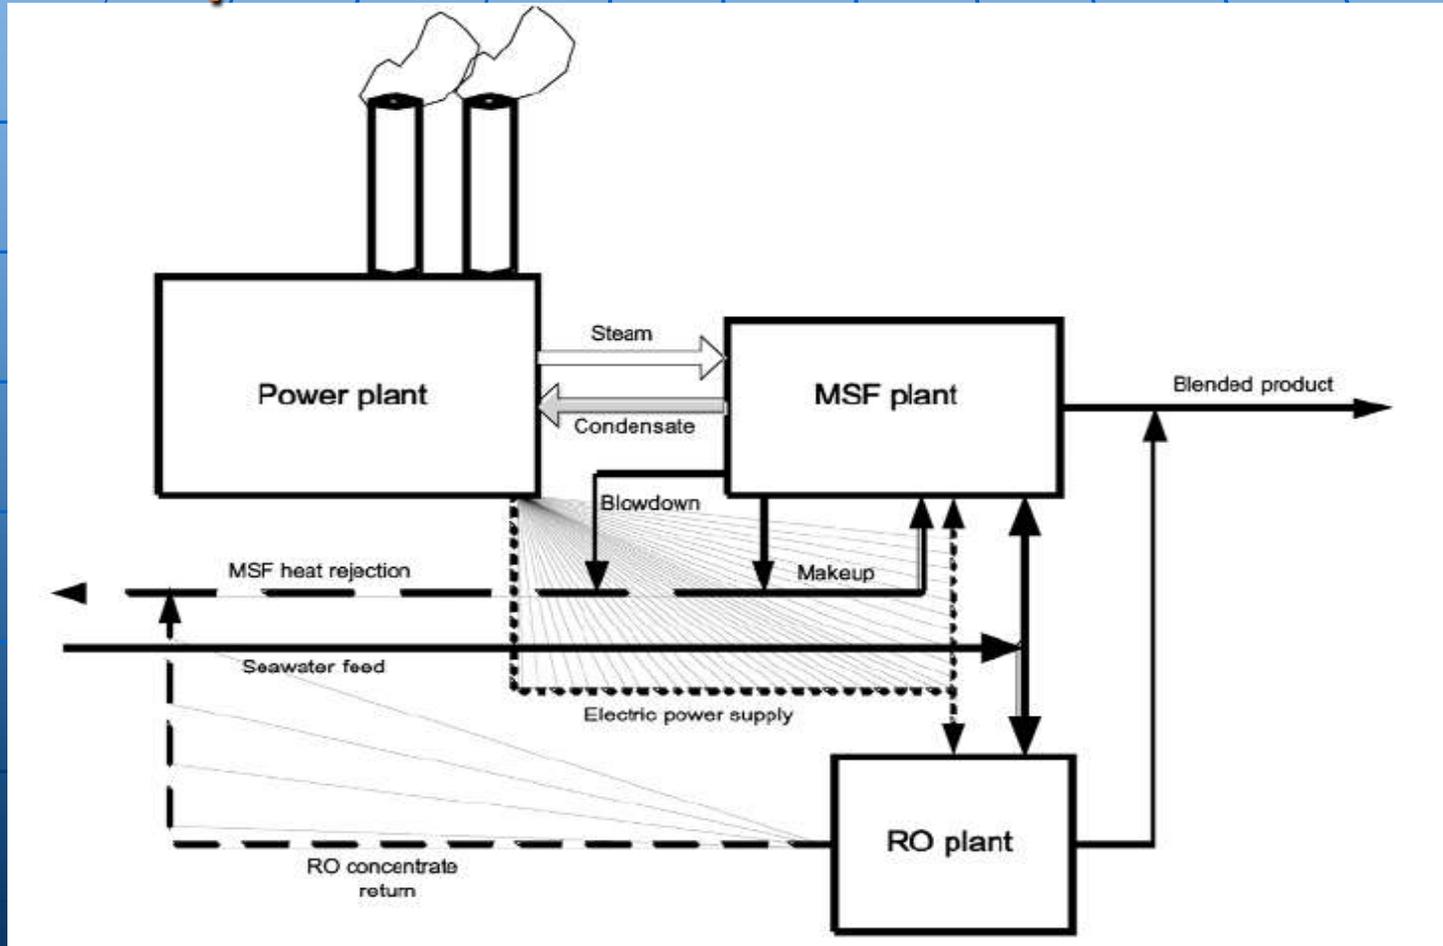

Courtesy of Leon Averbuch. Used with permission.

*LET Proprietary*

# Example of hybrid system components and their relations.

Courtesy of Leon Awerbuch. Used with permission.

# Past Simple hybrid

Product waters from the RO and Distillation plants are blended to obtain suitable product .

Power to water ratio can be significantly reduced.

## **GOING TO THE NEXT STEP**

A single stage RO process can be used.  
Higher Recovery lower pretreatment

Courtesy of Leon Awerbuch. Used with permission.

# Integrated hybrid

The feedwater temp. to the RO plant is optimized using cooling water from the heat-reject section of the MSF/MED or power plant condenser. Constant feed temperature

The low-pressure steam from the MSF/MED plant is used to de-aerate or use de-aerated brine as a feedwater to the RO plant to minimize corrosion and reduce residual chlorine.

Courtesy of Leon Awerbuch. Used with permission.

# Integrated hybrid

- **Blending distillate and membrane permeate will reduce requirements on Boron removal by RO.**

**The RO and NF membrane life can be extended. (12 years)**

Courtesy of Leon Awerbuch. Used with permission.

# **Integrated hybrid environmental benefits**

**Cool RO Reject and Feed to be used as a cooling source for heat reject section of distillation plants.**

**The blend of reject stream from RO with warm seawater and blowdown from distillation or power plants reduces heavy density plume of RO outfall.**

**Blend of RO permeate reduces temperature of distillate.**

**A common, smaller seawater intake & outfall.**

Courtesy of Leon Awerbuch. Used with permission.

*LET Proprietary*

# Fujairah Hybrid.

The Fujairah1 plant due to hybridization generates only 500 MW net electricity for export to the grid, and 662 MW gross for water production capacity of 100 MIGD. Otherwise similar MSF only plant in Shuweihat required 1500 MW for the same 100 MIGD capacity. The Fujairah desalination plant is split into 62.5 MIGD from the thermal part and 37.5 MIGD from the membrane process.

**Fujeirah 2 will be 100 MIGD MED and 30 MIGD RO**

Courtesy of Leon Awerbuch. Used with permission.

*LET Proprietary*

## Fujeirah Plant - Power Desalination Hybrid

*LET Proprietary*

Courtesy of Leon Awerbuch. Used with permission.

# *Benefits of Nanofiltration*

PREFERENTIALLY REMOVES SCALING  
(DIVALENT) IONS

ALLOWS HIGHER TOP BRINE TEMPERATURE  
FOR MSF (121 vs. 105 ° C)

Higher Flash Range Increases Production

Reduced MSF Capital Costs

Reduced MSF Operating Costs

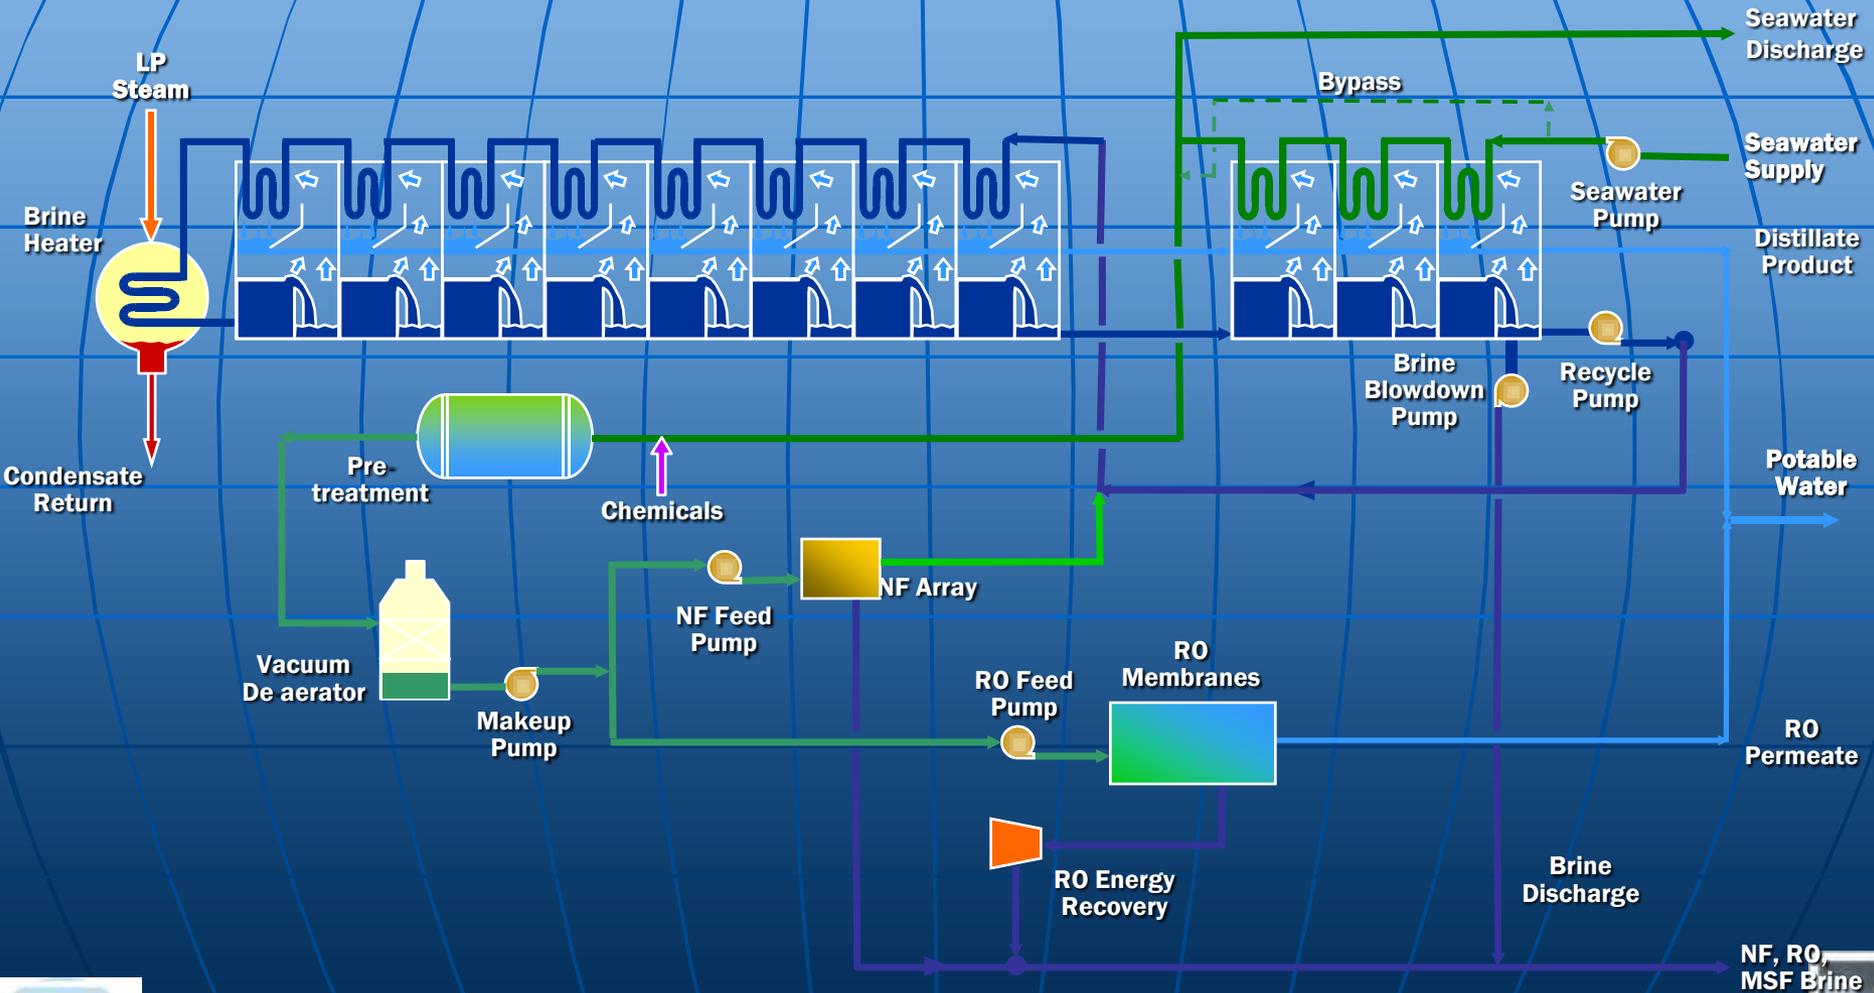

Courtesy of Leon Awerbuch. Used with permission.
