

Subject 24-242. Logic II. Homework due Thursday, April 29

A set  $A$  of natural numbers is said to be  $m$ -reducible (for “many-one reducible”) to a set  $B$  just in case there is a total  $\Sigma$  function  $f$  such that, for any  $n$ ,  $n$  is in  $A$  if and only if  $f(n)$  is in  $B$ .

$A$  is 1-reducible (for “one-one reducible”) to  $B$  just in case there is a one-one total  $\Sigma$  function  $f$  such that, for any  $n$ ,  $n$  is in  $A$  if and only if  $f(n)$  is in  $B$ .

1. Show that the following are equivalent, for any set  $A$ :

- (i)  $A$  is recursively enumerable (that is,  $\Sigma$ )
- (ii)  $A$  is 1-reducible to the set of Gödel numbers of valid sentences
- (iii)  $A$  is  $m$ -reducible to the set of Gödel numbers of valid sentences.

(i)  $\Rightarrow$  (ii). If  $A$  is recursively enumerable, then there is a  $\Sigma$  formula  $\phi(x)$ , with “ $x$ ” as its only free variable, that weakly represents  $A$  in  $Q$ . If we set  $f(n)$  equal to  $\ulcorner(Q \rightarrow \phi([n]))\urcorner$  (where “ $Q$ ” denotes the conjunction of the axioms of Robinson’s arithmetic), then we have  $n \in A$  iff  $Q \vdash \phi([n])$  iff  $(Q \rightarrow \phi([n]))$  is valid iff  $f(n) \in \{\text{Gödel numbers of valid sentences}\}$ .

(ii)  $\rightarrow$  (iii). Trivial.

(iii)  $\Rightarrow$  (i). Take a one-one total  $\Sigma$  function  $f$  such that, for any  $n$ , we have  $n \in A$  iff  $f(n) \in \{\text{Gödel numbers of valid formulas}\}$ ; we can find a bounded formula  $\phi(x,y,z)$  such that, for any  $n$  and  $m$ , we have  $f(n) = m$  iff  $(\exists z)\phi([n],[m],z)$  is true. We know that the set of Gödel numbers of valid formula is  $\Sigma$ , so that there is a bounded formula  $\psi(x,y)$  such that, for any  $m$ ,  $m$  is the Gödel number of a valid sentence iff  $(\exists y)\psi([m],y)$  is true. Then, for any  $n$ ,  $n \in A$  iff the  $\Sigma$  formula  $(\exists y)(\exists z)(\exists w)(\phi([n],y,z) \wedge \psi(y,w))$  is true.

2. Give an example of a  $\Sigma$  partial function that cannot be extended to a  $\Sigma$  total function.

Let  $f$  be the partial function that gives the value 1 if the input is (the Gödel number of) a theorem of  $Q$ , the value 0 if the input is a sentence refutable in  $Q$ , and is undefined otherwise.  $f$  is a  $\Sigma$  partial function, but it cannot be extended to a  $\Sigma$  total function, since if  $g$  were such a function, the  $\Sigma$  total function that takes  $x$  to  $\max(g(x), 1)$  would be the characteristic function of a recursive set that separates the theorems of  $Q$  from the sentences refutable in  $Q$ .
