## TA 24．973 April 809

## Tue Trinh

（1）Tense identification analysis
$\llbracket$ believe $\rrbracket^{\mathrm{w}, \mathrm{t}}=\lambda \mathrm{p}_{<\mathrm{s}, \mathrm{D}} \lambda \mathrm{x} . \forall \mathrm{w}^{\prime} . \mathrm{w}^{\prime}$ compatible with $\mathrm{x}^{\prime} \mathrm{s}$ belief in w at $\left.\mathrm{t} \rightarrow \mathrm{p}\left(<\mathrm{w}^{\prime}, \mathrm{t}\right\rangle\right)=1$
（2）＇At 4am，John believes it to be raining＇
$\llbracket$ pres［4am［john believe rain］］$\rrbracket^{w^{*}, t^{*}}=1$ iff
【4am［john believe rain］$\rrbracket^{w^{*}, t^{\prime}}=1$ ，iff
$\llbracket 4 \mathrm{am} \rrbracket^{\mathrm{w}^{*}, t^{\prime}}=1 \& \llbracket j o h n$ believe rain $\rrbracket^{\mathrm{w}^{*}, t^{\prime}}=1$ ，iff
【john believe rain $\rrbracket^{\mathrm{w}^{*}, 4 \mathrm{am}}=1$ ，iff
$\llbracket$ believe $\rrbracket^{\mathrm{w}^{*}, 4 \mathrm{am}}\left(\llbracket \mathrm{rain} \rrbracket_{\mathrm{q}}\right)(\mathrm{j})=1$ ，iff
$\forall \mathrm{w}^{\prime} . \mathrm{w}^{\prime}$ compatible with $\mathrm{j}^{\prime} \mathrm{s}$ belief in $\mathrm{w}^{*}$ at $4 \mathrm{am} \rightarrow \llbracket \mathrm{rain} \rrbracket_{\mathrm{c}}\left(<\mathrm{w}^{\prime}, 4 \mathrm{am}>=1\right.$ ，iff
for each $\mathrm{w}^{\prime}$ compatible with $\mathrm{j}^{\prime} \mathrm{s}$ belief in $\mathrm{w}^{*}$ at 4am，it rains in $\mathrm{w}^{\prime}$ at 4am
（3）（a）Scenario 1：In $w^{*}$ ，it rains only at 4am，John wakes up at 4am，thinking＂it＇s 5am and it＇s raining＂
（b）Intuition：$\llbracket$ At 4am，John believes it to be raining $\rrbracket^{\mathrm{w}^{*}, t^{*}}=1$
（b）Prediction：$\llbracket$ At 4am，John believes it to be raining $\rrbracket^{w^{*}, t^{*}}=0$
（c）Proof：Let it rain in $\mathrm{w}^{\prime}$ at 5am but not at 4am，and let John wake up at 5am in $\mathrm{w}^{\prime}$ ．Then $\mathrm{w}^{\prime}$ is compatible with John＇s belief in w＊at 4am．But it is not raining in w＇at 4am．
（4）（a）Scenario 2：In $\mathrm{w}^{*}$ ，John wakes up at 4am，thinking＂it＇5am，it rained at 4am but it has stopped＂
（b）Intuition：$\llbracket$ At 4am，John believes it to be raining $\rrbracket^{\mathrm{w}^{*}, \mathrm{t}^{*}}=0$
（b）Prediction：$\llbracket$ At 4am，John believes it to be raining $\rrbracket^{w^{*}, t^{*}}=1$
（c）Proof：Take any $\mathrm{w}^{\prime}$ compatible with John＇s belief in $\mathrm{w}^{*}$ at 4am．John wakes up at 5am in $\mathrm{w}^{\prime}$ and there is rain at 4am in $\mathrm{w}^{\prime}$ ．Thus，for any world $\mathrm{w}^{\prime}$ compatible with John＇s belief in $\mathrm{w}^{*}$ at 4am，it rains in w＇at 4am．
（5）Fixing the problem
（a）$\llbracket$ believe $\rrbracket^{\mathrm{w}, \mathrm{t}}=\lambda \mathrm{p}_{<\mathrm{s}, \mathrm{t}} \lambda \mathrm{x} . \forall<\mathrm{w}^{\prime}, \mathrm{t}^{\prime}>.<\mathrm{w}^{\prime}, \mathrm{t}^{\prime}>$ compatible with x ＇s belief in w at $\mathrm{t} \rightarrow \mathrm{p}\left(<\mathrm{w}^{\prime}, \mathrm{t}^{\prime}>\right)=1$
（b）$\llbracket 4 \mathrm{am}[$ john believes rain $] \rrbracket^{\mathrm{w}^{*}, \mathrm{t}^{*}}=1$ iff
【john believe rain】 ${ }^{w^{*}, 4 a \mathrm{~m}}=1$ ，iff
【believe $\rrbracket^{\mathrm{w}^{*}, 4 \mathrm{am}}\left(\llbracket \mathrm{rain} \rrbracket_{\mathrm{c}}\right)(\mathrm{j})=1$ ，iff
$\forall\left\langle w^{\prime}, t^{\prime}\right\rangle .\left\langle w^{\prime}, t^{\prime}\right\rangle$ compatible with $j^{\prime} s$ belief in $w^{*}$ at $4 a m \rightarrow \llbracket r a i n \rrbracket_{¢}\left(\left\langle w^{\prime}, t^{\prime}\right\rangle\right)=1$ ，iff
for each $<w^{\prime}, t^{\prime}>$ compatible with $j^{\prime}$＇s belief in $w^{*}$ at 4am，it is raining in $\mathrm{w}^{\prime}$ at $\mathbf{t}^{\prime}$
（6）Proof that in scenario 1 ，the sentence is true：
Take any $<\mathrm{w}^{\prime}, \mathrm{t}^{\prime}>$ compatible with John＇s belief in $\mathrm{w}^{*}$ at 4am．By hypothesis， $\mathrm{t}^{\prime}=5 \mathrm{am}$ and it rains in $\mathrm{w}^{\prime}$ at $\mathrm{t}^{\prime}$ ．Thus，it rains in $\mathrm{w}^{\prime}$ at $\mathrm{t}^{\prime}$ ．
（7）Proof that in scenario 2，the sentence is false：
Let it rain in $\mathrm{w}^{\prime}$ only at 4am，and let $\mathrm{t}^{\prime}=5 \mathrm{am}$ ．By hypothesis，＜ $\mathrm{w}^{\prime}, \mathrm{t}^{\prime}>$ is compatible with John＇s belief in $\mathrm{w}^{*}$ at 4am．But it does not rain in $\mathrm{w}^{\prime}$ at $\mathrm{t}^{\prime}$ ．
