3.23 Fall 2007 – Lecture 12

SEMICONDUCTORS

3.23 Electronic, Optical and Magnetic Properties of Materials - Nicola Marzari (MIT, Fall 2007)

Last time

1. Periodic potential: atomic + perturbation
2. Bloch sums of localized orbitals (atomic, or LCAO)
3. Tight-binding formulation (in the case only one orbital has significant overlap)
4. From flat atomic “bands” to dispersive cosines
5. Bandwidths
6. Tight-binding vs. empirical pseudopotential (i.e. a perturbation of the free electron gas)
7. Band structure (DETAILED) of a semiconductor

3.23 Electronic, Optical and Magnetic Properties of Materials - Nicola Marzari (MIT, Fall 2007)

The independent-electron gas

- Particle density

3.23 Electronic, Optical and Magnetic Properties of Materials - Nicola Marzari (MIT, Fall 2007)

The independent-electron gas

- Energy density

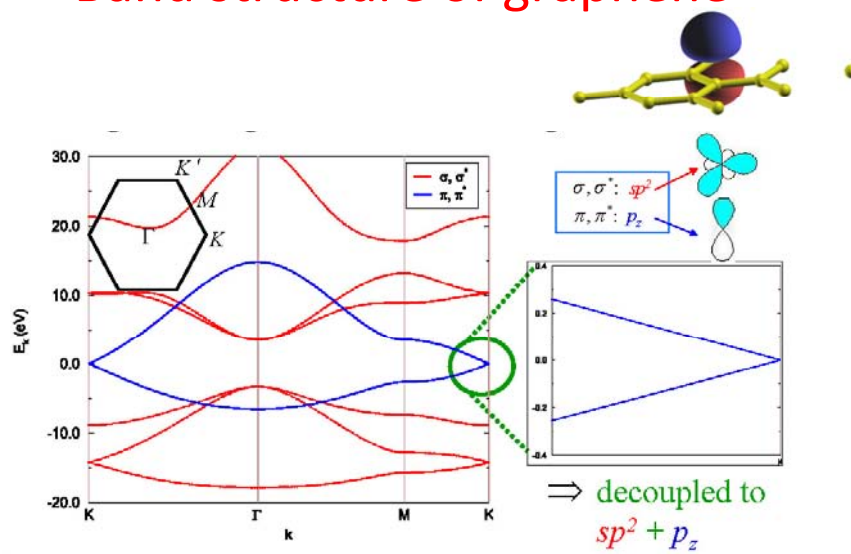

3.23 Electronic, Optical and Magnetic Properties of Materials - Nicola Marzari (MIT, Fall 2007)

Density of states (for any solid)

$$g_n(\varepsilon) = 2 \int \frac{1}{8\pi^3} \delta(\varepsilon - \varepsilon_n(\vec{k})) d\vec{k}$$

3.23 Electronic, Optical and Magnetic Properties of Materials - Nicola Marzari (MIT, Fall 2007)

Band structure of graphene

3.23 Electronic, Optical and Magnetic Properties of Materials - Nicola Marzari (MIT, Fall 2007)

Massive vs massless bands

Dimensions	d=1	d=2	d=3
Massless ($E \approx k$)	const	E	E^2
Massive ($E \approx k^2$)	1/sqrt(E)	const	sqrt(E)

$$g_n(\varepsilon) = 2 \int \frac{1}{8\pi^3} \frac{1}{|\nabla \varepsilon_n(\vec{k})|} dS$$

- S goes as k^{d-1} , where d is the dimensionality
- $\frac{1}{|\nabla \varepsilon(\vec{k})|}$ for a band that has k^l dispersions goes as $k^{-(l-1)}$,
- the integral goes as k^{d-l}
- energy is proportional to k^l , the integral goes as $\varepsilon^{(d-l)/l}$
