### 22.071/6.071 - Introduction to Electronics, Signals and Measurement Spring 2006

Homework 6
Due 3/22/06

Problem 1.
Calculate the currents $i 1(t)$ and $i 2(t)$ as shown on the following circuit

Problem 2.

Determine the voltage Vo for the following circuit. (Hint: superposition)

## Problem 3.

For the circuit below, determine the Thevenin equivalent circuit seen by capacitor C . (Hint: it helps if you work out the problem symbolically and then substitute for the element values.)

Problem 4.

Tau finds a black box with 3 terminals labeled X, Y, Z. Tau, who took 6.071 last year, decides to make resistance measurements across the terminals at $\mathrm{DC}(\omega=0 \mathrm{~Hz})$ and at high frequency ( $\omega$ large). She observes the following results:

|  | Resistance ( $\Omega$ ) at |  |
| :---: | :---: | :---: |
| Measure resistance across | DC | High-Freq. |
| $\mathrm{X}-\mathrm{Y}$ | $\infty$ | 40 |
| $\mathrm{Y}-\mathrm{Z}$ | 0 | $\infty$ |
| $\mathrm{X}-\mathrm{Z}$ | $\infty$ | $\infty$ |

Which of the following equivalent circuits is inside Tau's black box?

Circuit A

Circuit C

Circuit B

Circuit D

## Problem 5.

A motor is made up of a coil which has a resistance $R$ and an inductance $L$. We will set up an experiment to measure the values of $R$ and $L$. The circuit is shown below.

The motor runs with 60 Hz power and all measurements will be performed with the real source power connected to it and operating at a constant load (steady state). Using a voltmeter set in AC mode (i.e measure the RMS value of a sinusoidal voltage) we perform the following measurements.

Vs $=220$ Volts , Va $=75$ Volts , Vm $=110$ Volts

Use these measurements to determine $R$ and $L$
