

Finger Exercises Lecture 16

The questions below are due on Monday November 07, 2022; 03:00:00 PM.

1) Question 1 of 1

Implement the function that meets the specification below.:

```
def flatten(L):  
    """  
    L: a list  
    Returns a copy of L, which is a flattened version of L  
    """  
  
    # Your code here  
  
# Examples:  
L = [[1,4,[6],2],[[3]],2],4,5]  
print(flatten(L)) # prints the list [1,4,6,2,3,2,4,5]
```

```
1 # your function here
```

You have infinitely many submissions remaining.

Here is the solution we wrote:

```
def flatten(L):  
    result = []  
    for i in L:  
        if type(i) == list:  
            result.extend(flatten(i))  
        else:  
            result.append(i)  
    return result
```
