Design and verification dominate escalating project costs

February 22, 2005

<http://csg.csail.mit.edu/6.884/>

L07-2

Common quotes

- ◆ “Design is not a problem; design is easy”
- ◆ “Verification is a problem”
- ◆ “Timing closure is a problem”
- ◆ “Physical design is a problem”

Mind set

Almost complete reliance on post-design verification for quality

February 22, 2005

<http://csg.csail.mit.edu/6.884/>

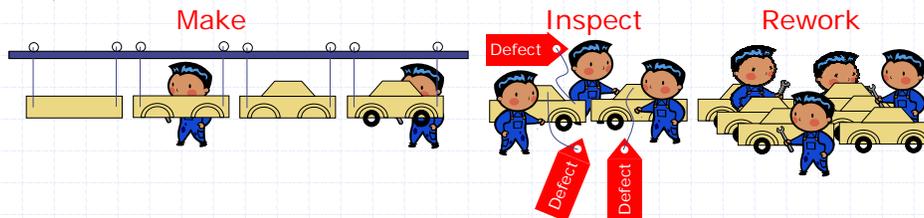

L07-3

Through the early 1980s:

The U.S. auto industry

- ◆ Sought quality solely through post-build inspection
- ◆ Planned for defects and rework

and U.S. quality was...

February 22, 2005

<http://csg.csail.mit.edu/6.884/>

L07-4

... less than world class

Image of Chevrolet Chevette removed due to copyright restrictions.

- ◆ Adding quality inspectors (“verification engineers”) and giving them better tools, was not the solution
- ◆ The Japanese auto industry showed the way
 - “Zero defect” manufacturing

February 22, 2005

<http://csg.csail.mit.edu/6.884/>

L07-5

New mind set:

Design affects everything!

- ◆ A good design methodology
 - Can keep up with changing specs
 - Permits architectural exploration
 - Facilitates verification and debugging
 - Eases changes for timing closure
 - Eases changes for physical design
 - Promotes reuse

⇒ It is essential to

Design for Correctness

February 22, 2005

<http://csg.csail.mit.edu/6.884/>

L07-6

Why is traditional RTL too low-level?

Examples with dynamic and static constraints

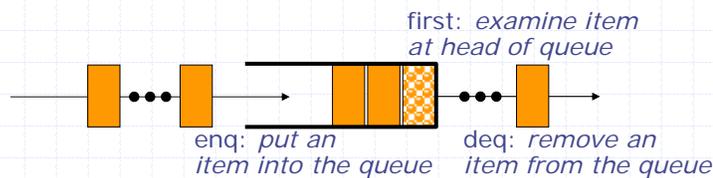

February 22, 2005

<http://csg.csail.mit.edu/6.884/>

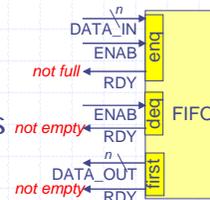

L07-7

Design must follow many rules ("micro-protocols")

Consider a FIFO (a queue)

In the hardware, there are a number of requirements for correct use

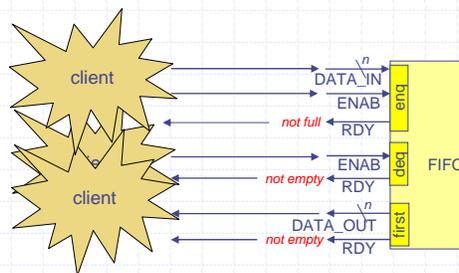

February 22, 2005

<http://csg.csail.mit.edu/6.884/>

L07-8

Requirements for correct use

- Requirement 1: `deq` ENAB only when RDY (not empty)
- Requirement 2: first DATA_OUT only when RDY (not empty)
- Requirement 3: `enq` ENAB simultaneously with DATA_IN
- Requirement 4: `enq` ENAB only when RDY (not full)

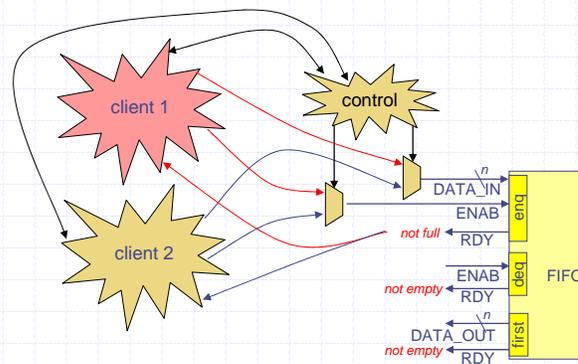

February 22, 2005

<http://csg.csail.mit.edu/6.884/>

L07-9

Correct use of a shared FIFO

- Needs a multiplexer in front of each input ()
- Needs proper control logic for the multiplexer

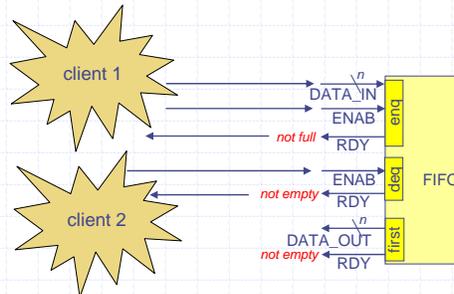

February 22, 2005

<http://csg.csail.mit.edu/6.884/>

L07-10

Concurrent uses of a FIFO

enq ENAB ok if deq ENAB, even if not RDY ??

February 22, 2005

<http://csg.csail.mit.edu/6.884/>

L07-11

Example from a commercially available FIFO IP component

An error occurs if a push is attempted while the FIFO is full.

Thus, there is no conflict in a simultaneous push and pop when the FIFO is full. A simultaneous push and pop cannot occur when the FIFO is empty, since there is no pop data to prefetch. However, push data is captured in the FIFO.

A pop operation occurs when `pop_req_n` is asserted (LOW), as long as the FIFO is not empty. Asserting `pop_req_n` causes the internal read pointer to be incremented on the next rising edge of `clk`. Thus, the RAM read data must be captured on the `clk` following the assertion of `pop_req_n`.

<code>data_in</code>	<code>data_out</code>
<code>push_req_n</code>	<code>full</code>
<code>pop_req_n</code>	<code>empty</code>
<code>clk</code>	
<code>rstn</code>	

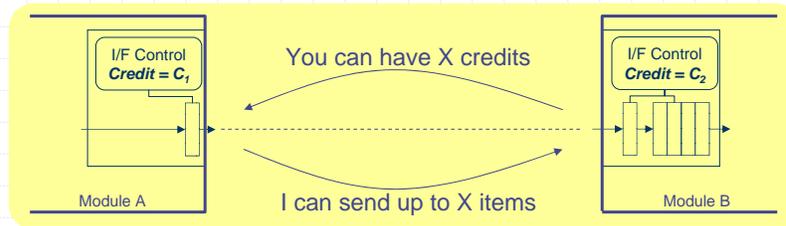

These constraints are taken from several paragraphs of documentation, spread over many pages, interspersed with other text

February 22, 2005

<http://csg.csail.mit.edu/6.884/>

L07-12

A High-Bandwidth Credit-based Communication Interface

- ◆ Static correctness constraints:
 - Data types agree on both ends?
 - Credit values agree ($C_1 == C_2$)?
 - Credit values automatically sized to comm latency?
 - B's buffer properly sized (C_2)?
 - B's buffer pointers properly sized ($\log(C_2)$)?

February 22, 2005

<http://csg.csail.mit.edu/6.884/>

L07-13

Why is Traditional RTL low-level?

- ◆ Hardware for dynamic constraints must be *designed explicitly*
- ◆ Design assumptions must be *explicitly verified*
- ◆ Design assumptions must be *explicitly maintained* for future changes
- ◆ If static constraints are *not checked* by the compiler then they must also be *explicitly verified*

February 22, 2005

<http://csg.csail.mit.edu/6.884/>

L07-14

In Bluespec SystemVerilog (BSV) ...

- ◆ Power to express complex static structures and constraints
 - Checked by the compiler
- ◆ "Micro-protocols" are managed by the compiler
 - The compiler generates the necessary hardware (muxing and control)
 - Micro-protocols need less or no verification
- ◆ Easier to make changes while preserving correctness

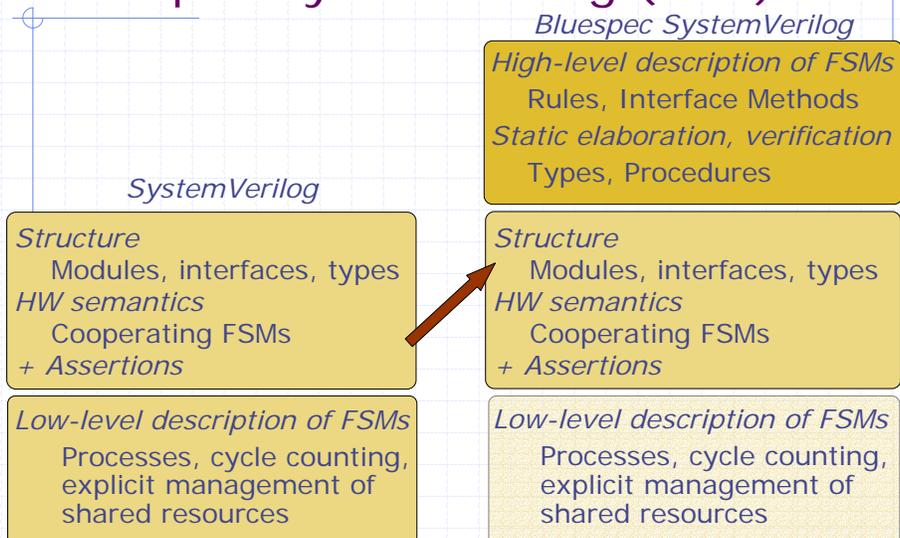

→ *Smaller, simpler, clearer, more correct code*

February 22, 2005

<http://csg.csail.mit.edu/6.884/>

L07-15

Bluespec SystemVerilog (BSV)

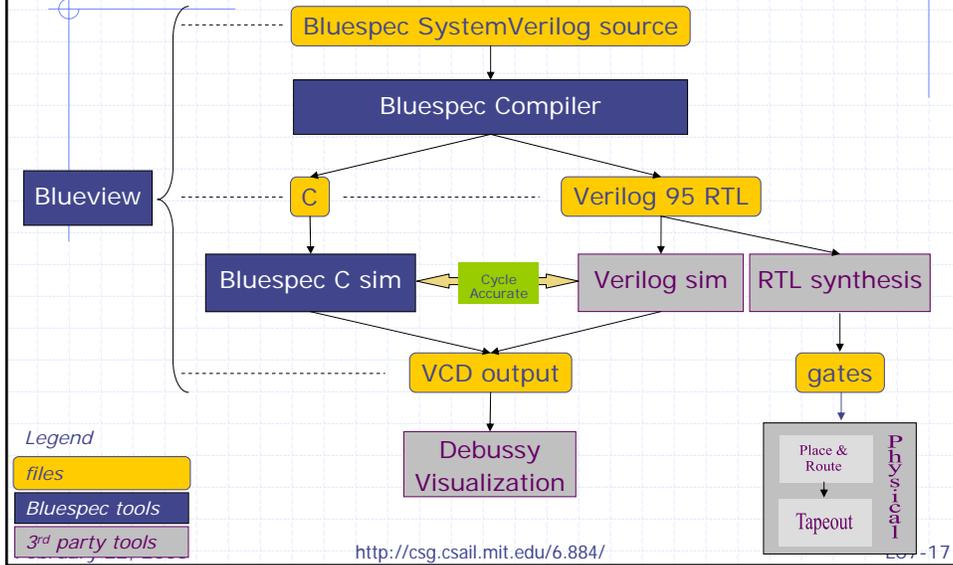

February 22, 2005

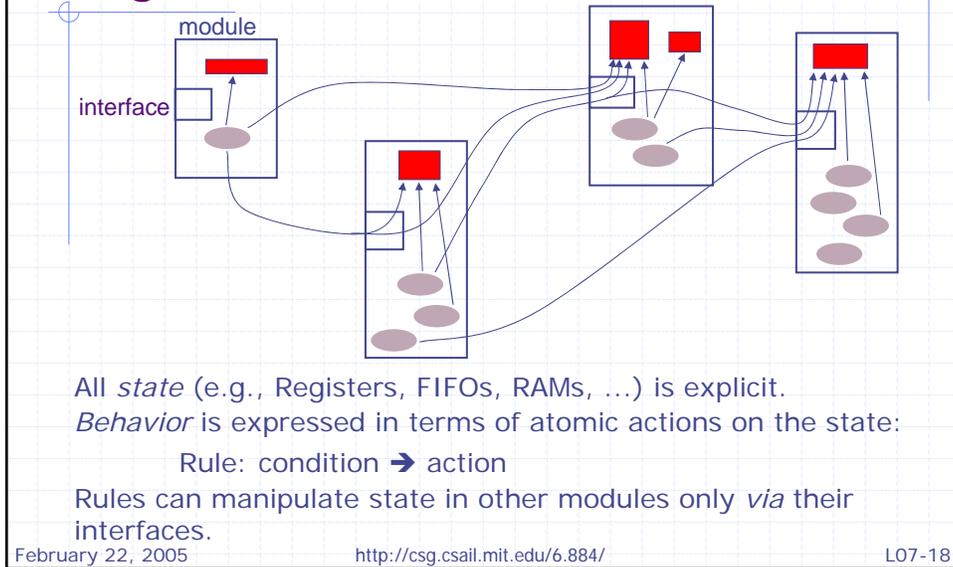

<http://csg.csail.mit.edu/6.884/>

L07-16

Bluespec Tool flow

Bluespec: State and Rules organized into *modules*

Programming with rules: A simple example

Euclid's algorithm for computing the Greatest Common Divisor (GCD):

15	6	
9	6	<i>subtract</i>
3	6	<i>subtract</i>
6	3	<i>swap</i>
3	3	<i>subtract</i>
0	<i>answer:</i> 3	<i>subtract</i>

February 22, 2005

<http://csg.csail.mit.edu/6.884/>

L07-19

GCD in BSV

```
module mkGCD (ArithIO#(int));
  Reg#(int) x <- mkRegU;
  Reg#(int) y <- mkReg(0);

  rule swap ((x > y) && (y != 0));
    x <= y; y <= x;
  endrule
  rule subtract ((x <= y) && (y != 0));
    y <= y - x;
  endrule

  method Action start(int a, int b) if (y==0);
    x <= a; y <= b;
  endmethod
  method int result() if (y==0);
    return x;
  endmethod
endmodule
```

State

Internal behavior

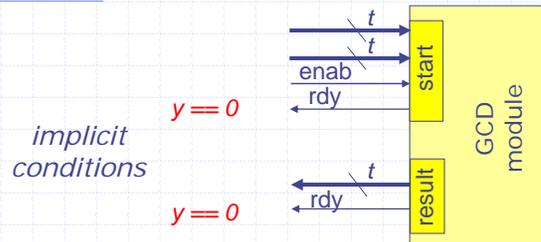

External interface

February 22, 2005

<http://csg.csail.mit.edu/6.884/>

L07-20

GCD Hardware Module

```
interface ArithIO #(type t);
    method Action start (t a, t b);
    method t result();
endinterface
```

Many different implementations can provide the same interface:

```
module mkGCD (ArithIO#(int));
```

February 22, 2005

<http://csg.csail.mit.edu/6.884/>

L07-21

Generated Verilog RTL: gcd

```
module mkGCD(CLK, RST_N, start_1, start_2, E_start_, ...)
    input CLK; ...
    output start_rdy; ...
    wire [31 : 0] x$get; ...
    assign result_ = x$get;
    assign _d5 = y$get == 32'd0;
    ...
    assign _d3 = x$get ^ 32'h80000000) <= (y$get ^ 32'h80000000);
    assign C__2 = _d3 && !_d5;
    ...
    assign x$set = E_start_ || P__1;
    assign x$set_1 = P__1 ? y$get : start_1;
    assign P__2 = _d3 && !_d5;
    ...
    assign y$set_1 =
        {32{P__2}} & y$get - x$get | {32{dt1}} & x$get |
        {32{dt2}} & start_2;
    RegN #(32) i_x(.CLK(CLK), .RST_N(RST_N), .val(x$set_1), ...)
    RegN #(32) i_y(.CLK(CLK), .RST_N(RST_N), .init(32'd0), ...)
endmodule
```

February 22, 2005

<http://csg.csail.mit.edu/6.884/>

L07-22

Exploring microarchitectures

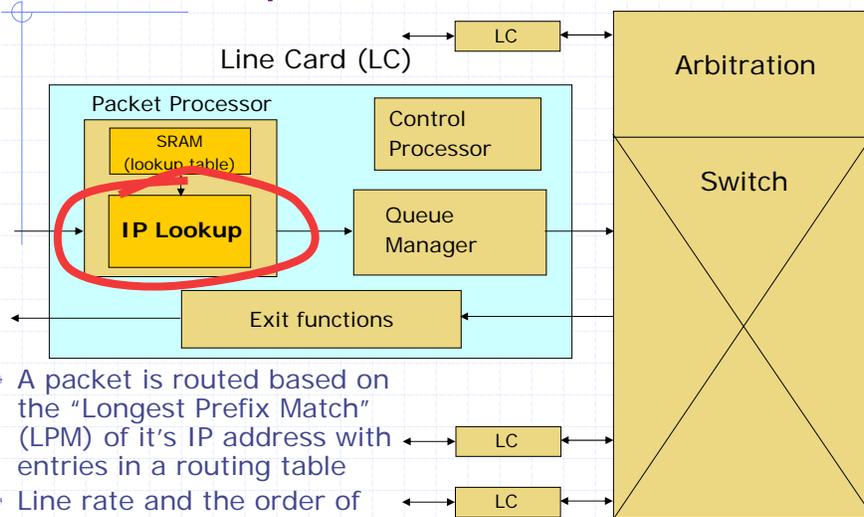

IP Lookup Module

February 22, 2005

<http://csg.csail.mit.edu/6.884/>

L07-23

IP Lookup block in a router

- A packet is routed based on the "Longest Prefix Match" (LPM) of its IP address with entries in a routing table
- Line rate and the order of arrival must be maintained

line rate ⇒ 15Mpps for 10GE

February 22, 2005

<http://csg.csail.mit.edu/6.884/>

L07-24

Sparse tree representation

7.14.*.*	A
7.14.7.3	B
10.18.200.*	C
10.18.200.5	D
5.*.*.*	E
*	F

IP address	Result	M Ref
7.13.7.3	F	2
10.18.201.5	F	3
7.14.7.2	A	4
5.13.7.2	E	1
10.18.200.7	C	4

Real-world lookup algorithms are more complex but all make a sequence of dependent memory references.

February 22, 2005 <http://csg.csail.mit.edu/6.884/> L07-25

SW ("C") version of LPM

```

int
lpm (IPA ipa)          /* 3 memory lookups */
{
    int p;

    p = RAM [ipa[31:16]]; /* Level 1: 16 bits */
    if (isLeaf(p)) return p;

    p = RAM [p + ipa [15:8]]; /* Level 2: 8 bits */
    if (isLeaf(p)) return p;

    p = RAM [p + ipa [7:0]]; /* Level 3: 8 bits */
    return p;                /* must be a leaf */
}

```

How to implement LPM in HW?
Not obvious from C code!

Longest Prefix Match for IP lookup: 3 possible implementation architectures

Rigid pipeline

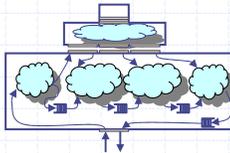

Inefficient memory usage but **simple** design

Designer's Ranking:

①

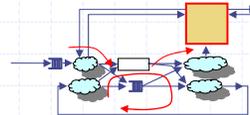

Linear pipeline

Efficient memory usage through memory port replicator

②

Circular pipeline

Efficient memory usage with most **complex** control

③

Which is "best"?

Arvind, Nikhil, Rosenband & Dave ICCAD 2004

L07-27

Synthesis results

LPM versions	Code size (lines)	Best Area (gates)	Best Speed (ns)	Mem. util. (random workload)
Static V	220	2271	3.56	63.5%
Static BSV	174	2327 (3% larger)	3.57 (7% of best)	63.5%
Linear V	410	14759	4.7	99.9%
Linear BSV	168	15910 (8% larger)	4.7 (same)	99.9%
Circular V	364	8103	3.62	99.9%
Circular BSV	257	8170 (1% larger)	3.67 (2% slower)	99.9%

Synthesis: TSMC 0.18 μ m lib

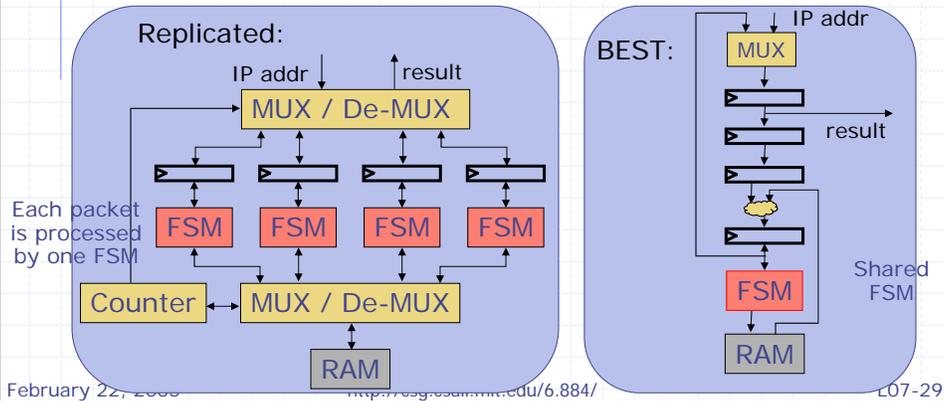

- Bluespec results can match carefully coded Verilog
- Micro-architecture has a dramatic impact on performance
- Architecture differences are much more important than language differences in determining QoR

V = Verilog; BSV = Bluespec System Verilog

L07-28

Implementations of the same arch - Static pipeline: Two designers, two results

LPM versions	Best Area (gates)	Best Speed (ns)
Static V (Replicated)	8898	3.60
Static V (BEST)	2271	3.56

Reorder Buffer

Verification-centric design

But, what about all the potential race conditions?

- ◆ Reading from the register file at the same time a separate instruction is writing back to the same location
 - Which value to read?
- ◆ An instruction is being inserted into the ROB simultaneously to a dependent upstream instruction's result coming back from an ALU
 - Put a tag or the value in the operand slot?
- ◆ An instruction is being inserted into the ROB simultaneously to a branch mis-prediction must kill the mis-predicted instructions and restore a "consistent state" across many modules

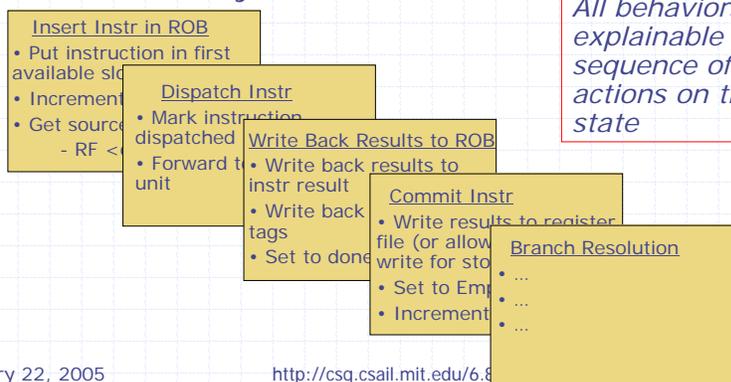

February 22, 2005

<http://csg.csail.mit.edu/6.884/>

L07-33

Rule Atomicity

- ◆ Lets you code each operation in isolation
- ◆ Eliminates the nightmare of race conditions ("inconsistent state") under such complex concurrency conditions

All behaviors are explainable as a sequence of atomic actions on the state

February 22, 2005

<http://csg.csail.mit.edu/6.884/>

L07-34

Synthesizable model of IA64

CMU-Intel collaboration

- ◆ Develop an Itanium μ arch model that is
 - concise and malleable
 - *executable and synthesizable*
- ◆ FPGA Prototyping
 - XC2V6000 FPGA interfaced to P6 memory bus
 - Executes binaries natively against a real PC environment (i.e., memory & I/O devices)
- ◆ An evaluation vehicle for:
 - Functionality and performance: a fast μ architecture emulator to run real software
 - Implementation: a synthesizable description to assess feasibility, design complexity and implementation cost

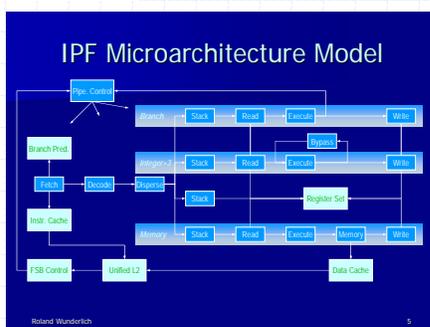

Roland Wunderlich & James Hoe @ CMU
Steve Hynal(SCL) & Shih-Lien Liu(MRL)

February 22, 2005

<http://csg.csail.mit.edu/6.884/>

L07-35

IA64 in Bluespec Wunderlich & Hoe

Platform Capabilities

- High speed execution of the Bluespec model, runs at 100 MHz, 4 orders of magnitude faster than ModelSim
- Full access to the FSB, allowing 800 MB/s cache line reads and writes, plus a control channel to the Pentium III processor via mapped I/O
- Large FPGA resources, the current design occupies less than 30% of the FPGA resources

The model was developed in a few months by one student!

February 22, 2005

<http://csg.csail.mit.edu/6.884/>

L07-36
