

TAL SCULLY; Experimental physics is cool. J-Lab has a very wide range of experiments that you can do, actually. So my partner and I, we did a biophysics experiment, we did a spectroscopy experiment, which is like physical chemistry, and then we did an experiment with cosmic ray muons. So particle physics. So we covered a wide range of ways to apply physics to the real world. And it was really neat to see that range and interact with it and analyze data for lots of different fields of physics. So that was nice.
