Error in Fabrication

Continuous Glass Surface
Quarter Scale Construction

Problems

1. Poor relationship between tools

2. Design is a rain-screen

3. Inconsistent connections at joints from error in measuring, cutting and assembly
Error in Fabrication

Research Questions

Can curved surfaces be modeled in a design office?

Is it possible to construct buildings with smooth continuous transparent structures?

Can the surface be waterproof
Assembly Design

Assembly design accompanies material, machine and cost selections.

Sequence of assembly should be a major criteria in assembly design.

*Assembly design is an iterative process* as much as it is a destiny - The first model is only the beginning of the process.

Design Factors (Geometry)
1. Part Function - Goal
2. Materials
3. Assembly structure
4. Machining
5. Tolerance between parts
No assemblies

Assembly

Integration

Three different production methods for zip fasteners.

Automated Designing Assemblies

Figure by MIT OpenCourseWare.
Factors in Automated Assembly

- Automate assembly process using machines that assemble parts on a line
- Increase productivity and reduce cost
- Build a more consistent product with higher reliability
Designing Assemblies

- The process should always include methods to improve design of assembly
- The design should be systematic
- The assembly process should be measurable
Contains two or more joints

a) An assembly of parts contains a start base

b) The start base or part should contain spring angles

c) The assembly angle should be assured during manufacturing
Assembly Types
Integral Attachments

a) Term was developed by the plastics industries in the mid 1990's

b) Flexibility in design

c) Measurable (Computable)

"A snap-fit is a mechanical joint system where part-to-part attachment is accomplished with locating and locking features (constraint features) that are homogenous with one or the other of the components being joined."

- The First Snap-Fit Handbook, Bonenberger, 2000
Snap Fit

• Important Criterion – Flexibility in integral locking feature

• Joining method using springy (elastic) properties of metals and plastics
  – Plastic – Plastic
  – Plastic – Metal
  – Metal – Metal
  • Although most commonly used today with plastic assembled parts, snap-fit has long before existed in metal-metal components in clothing

• Results in reduced man-hour, production cost, and or number of parts in assembly
Snap fit examples

- Toys
- Small Appliances
- Automotive
- Electronic Fields
Cantilever

"U" Shaped Cantilever

"L" Shaped Cantilever

Figure by MIT OpenCourseWare.
K’nex
Example: Duracon M90-44

Yield strain: 7 - 8%
Thickness: \( h = 3\text{mm} \)
Height: \( Y = 2\text{mm} \)
Span: \( L = 10\text{mm} \)

Strain = 9%

\[
\varepsilon = \frac{3Yh_o}{2L^2}
\]
