

Lecture 3: Operators

Kenya 2005

Lecture Outline

- What operators are
- Arithmetic Operators such as +, -
- Assignment Operator
- Increment/Decrement Operators e.g i++
- Relational Operators
- Conditional Operators

What are Operators?

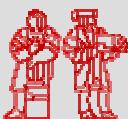

- Operators are special symbols used for:
 - mathematical functions
 - assignment statements
 - logical comparisons

- Examples of operators:

$3 + 5$ // uses + operator

$14 + 5 - 4 * (5 - 3)$ // uses +, -, * operators

- *Expressions* can be combinations of variables, primitives and operators that result in a value

The Operator Groups

- There are 5 different groups of operators:
 - Arithmetic Operators
 - Assignment Operator
 - Increment / Decrement Operators
 - Relational Operators
 - Conditional Operators
- The following slides will explain the different groups in more detail.

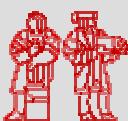

Arithmetic Operators

- Java has 6 basic arithmetic operators :

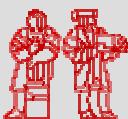

+	add
-	subtract
*	multiply
/	divide
%	modulo (remainder)
^	exponent (to the power of)

- The order of operations (or precedence) when evaluating an expression can be summarized in the acronym PEMDAS.

Order Of Operations

- Order of Operations (**PEMDAS**)
 1. **P**arentheses
 2. **E**xponents
 3. **M**multiplication and **D**ivision from left to right
 4. **A**ddition and **S**ubtraction from left to right
- An easy way to remember this is:
“Please Excuse My Dear Aunt Sally” !

Order of Operations (Cont'd)

- Example: $10 + 15 / 5$;
- The result is different depending on whether the addition or division is performed first

$$(10 + 15) / 5 = 5$$

$$10 + (15 / 5) = 13$$

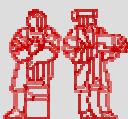

Without parentheses, Java will choose the second case

- Note: you should be explicit and use parentheses to avoid confusion

Integer Division

- In the previous example, we were lucky that $(10 + 15) / 5$ gives an exact integer answer (5).
- But what if we divide 63 by 35?
- Depending on the data types of the variables that store the numbers, we will get different results.

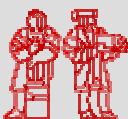

Integer Division (Cont'd)

- ```
int i = 63;
int j = 35;
System.out.println(i / j);
```

Output: 1
- ```
double x = 63;  
double y = 35;  
System.out.println(x / y);
```

Ouput: 1.8
- The result of integer division is just the integer part of the quotient!

Assignment Operator

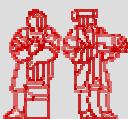

- The basic assignment operator (=) assigns the value of `expr` to `var`

```
var = expr ;
```

- Java allows you to combine arithmetic and assignment operators into a single operator
- Examples:

`x = x + 5 ;` is equivalent to `x += 5 ;`

`y = y * 7 ;` is equivalent to `y *= 7 ;`

Increment/Decrement Operators

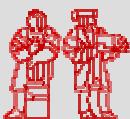

- `++` is called the increment operator. It is used to increase the value of a variable by 1.

For example:

`i = i + 1;` can be written as:
`++i;` or `i++;`

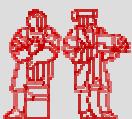

- `--` is called the decrement operator. It is used to decrease the value of a variable by 1.

`i = i - 1;` can be written as:
`--i;` or `i--;`

Increment Operators (cont'd)

- The increment / decrement operator has two forms :
 - Prefix Form e.g `++i; --i;`
 - Postfix Form e.g `i++; i--;`

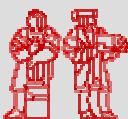

Prefix increment /decrement

- The prefix form first adds/ subtracts 1 from the variable and then continues to any other operator in the expression
- Example:

```
int numOranges = 5;  
int numApples = 10;  
int numFruit;  
numFruit = ++numOranges + numApples;
```

numFruit has value 16
numOranges has value 6

Postfix Increment/ Decrement

- The postfix form `i++`, `i--` first evaluates the entire expression and then adds 1 to the variable
- Example:

```
int numOranges = 5;  
int numApples = 10;  
int numFruit;  
numFruit = numOranges++ + numApples;
```

`numFruit` has value 15
`numOranges` has value 6

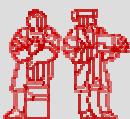

Relational (Comparison) Operators

- Relational operators compare two values
- They Produce a boolean value (**true** or **false**) depending on the relationship

OperationIs true when
$a > b$	a is greater than b
$a \geq b$	a is greater than or equal to b
$a == b$	a is equal to b
$a != b$	a is not equal to b
$a \leq b$	a is less than or equal to b
$a < b$	a is less than b

Note: == sign!

Examples of Relational Operations

```
int x = 3;  
int y = 5;  
boolean result;
```

1) `result = (x > y);`

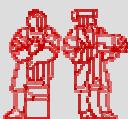

now `result` is assigned the value `false` because
3 is **not greater** than 5

2) `result = (15 == x*y);`

now `result` is assigned the value `true` because the product of
3 and 5 **equals** 15

3) `result = (x != x*y);`

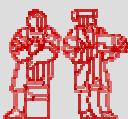

now `result` is assigned the value `true` because the product of
`x` and `y` (15) is **not equal** to `x` (3)

Conditional Operators

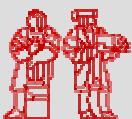

Symbol	Name
&&	AND
	OR
!	NOT

- Conditional operators can be referred to as **boolean** operators, because they are only used to combine expressions that have a value of **true** or **false**.

Truth Table for Conditional Operators

x	y	$x \&& y$	$x y$	$!x$
True	True	True	True	False
True	False	False	True	False
False	True	False	True	True
False	False	False	False	True

Examples of Conditional Operators

```
boolean x = true;  
boolean y = false;  
boolean result;
```

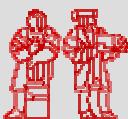

1. Let **result** = (**x** && **y**) ;

now **result** is assigned the value **false**
(see truth table!)

2. Let **result** = ((**x** || **y**) && **x**) ;

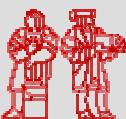

(**x** || **y**) evaluates to **true**
(**true** && **x**) evaluates to **true**

now **result** is assigned the value **true**

Using && and ||

- Java performs ***short-circuit evaluation***: By this we mean that it evaluates `&&` and `||` expressions from left to right and *once it finds the result, it stops.*
- Examples:
`(a && (b++ > 3))`
`(x || y)`
- Java will evaluate these expressions from left to right and so will evaluate
a before `(b++ > 3)`
x before y

Short-Circuit Evaluation

```
(a && (b++ > 3));
```

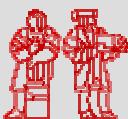

What happens if **a** is **false**?

- Java will not evaluate the right-hand expression (**b++ > 3**) if the left-hand operator **a** is false, since the result is already determined in this case to be **false**. This means **b** will not be incremented!

```
(x || y);
```

What happens if **x** is **true**?

- Similarly, Java will not evaluate the right-hand operator **y** if the left-hand operator **x** is true, since the result is already determined in this case to be **true**.

POP QUIZ

1) What is the value of `number`?

```
int number = 5 * 3 - 3 / 6 - 9 * 3;
```

2) What is the value of `result`?

```
int x = 8;
```

```
int y = 2;
```

```
boolean result = (15 == x * y);
```

3) What is the value of `result`?

```
boolean x = 7;
```

```
boolean result = (x < 8) && (x > 4);
```

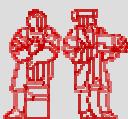

4) What is the value of `numCars`?

```
int numBlueCars = 5;
```

```
int numGreenCars = 10;
```

```
int numCars = numGreenCars++ +
```

```
numBlueCars + ++numGreenCars;
```

POP Quiz Solutions

1) What is the value of `number`? -12

```
int number = 5 * 3 - 3 / 6 - 9 * 3;
```

2) What is the value of `result`? false

```
int x = 8;
```

```
int y = 2;
```

```
boolean result = (15 == x * y);
```

3) What is the value of `result`? true

```
boolean x = 7;
```

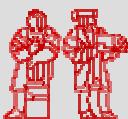

```
boolean result = (x < 8) && (x > 4);
```

4) What is the value of `numCars`? 27

```
int numBlueCars = 5;
```

```
int numGreenCars = 10;
```

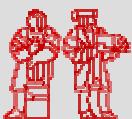

```
int numCars = numGreenCars++ + numBlueCars +
               ++numGreenCars;
```

Reference

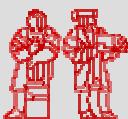

- Summary of Java operators

<http://java.sun.com/docs/books/tutorial/java/nutsandbolts/opsummary.html>

This Lecture Covered....

- What Operators are
- The different types of operators
- The order of Operations for arithmetic operators
- Prefix and Postfix operators
- Short Circuit Evaluation
