This quiz is open book and open notes, but do not use a computer.

Please write your name on the top of each page. Answer all questions in the boxes provided.

1) Are each of the following True or False (15 points)

1.1. In Python the values of a dict must be immutable.
1.2. There exist problems that cannot be solved in Python without using either iteration or recursion.
1.3. Floating point arithmetic behaves exactly like normal arithmetic on real numbers.
1.4. On all inputs, a bisection search will run faster than a linear search.
1.5. Let \( L \) be a list, each element of which is a list of ints. In Python, the assignment statement \( L[0][0] = 3 \) mutates the list \( L \).
2) What does the following code print? (10 points)

```python
T = (0.1, 0.1)
x = 0.0
for i in range(len(T)):
    for j in T:
        x += i + j
        print x
print i
```
3) What does the following code print? (10 points)

```python
def f(s):
    if len(s) <= 1:
        return s
    return f(f(s[1:])) + s[0]  # Note double recursion

print f('mat')
print f('math')
```
def findAll(wordList, lStr):
    """assumes: wordList is a list of words in lowercase.
    lStr is a str of lowercase letters.
    No letter occurs in lStr more than once
    returns: a list of all the words in wordList that contain
    each of the letters in lStr exactly once and no
    letters not in lStr."""
5) The following code does not meet its specification. Correct it. (8 points)

def addVectors(v1, v2):
    """assumes v1 and v2 are lists of ints.
    Returns a list containing the pointwise sum of
    the elements in v1 and v2. For example,
    addVectors([4,5], [1,2,3]) returns [5,7,3], and
    addVectors([], []) returns []. Does not modify inputs."""
    if len(v1) > len(v2):
        result = v1
        other = v2
    else:
        result = v2
        other = v1
    for i in range(len(other)):
        result[i] += other[i]
    return result
6.00 Quiz 1, 2011

Name

6) Consider the following code:

```python
def f(s, d):
    for k in d.keys():
        d[k] = 0
    for c in s:
        if c in d:
            d[c] += 1
        else: d[c] = 0
    return d

def addUp(d):
    result = 0
    for k in d:
        result += d[k]
    return result

d1 = {}
d2 = d1
d1 = f('abbc', d1)
print addUp(d1)
d2 = f('bbcaa', d2)
print addUp(d2)
print f('', {})
print result
```

6.1) What does it print? (9 points)

```
22
10
0
```

6.2) Does it terminate normally? Why or why not? (4 points)

```
Yes, it terminates normally. The code performs a series of operations on dictionaries and prints the results of those operations. There are no infinite loops or other mechanisms that would cause the program to run indefinitely.
```
7) Consider the following code:

def logBase2(n):
    """assumes that n is a positive int
    returns a float that approximates the log base 2 of n"
    import math
    return math.log(n, 2)

def f(n):
    """assumes n is an int"
    if n < 1:
        return
    curDigit = int(logBase2(n))
    ans = 'n = '
    while curDigit >= 0:
        if n%(2**curDigit) < n:
            ans = ans + '1'
            n = n - 2**curDigit
        else:
            ans = ans + '0'
        curDigit -= 1
    return ans

for i in range(3):
    print f(i)

7.1) What does it print? (10 points)

7.2) Under the assumption that \( \log_{2} \) is \( O(n) \), what is the order (use big Oh notation) of \( f \)? (5 points)
8) Next to each item in the left column write the letter labeling the item in the right column that best matches the item in the left column. No item in the right column should be used more than once. (9 points)

- Big O notation
  - a) induction
- Newton’s method
  - b) upper bound
- recursion
  - c) lower bound
  - d) approximation
  - e) expected running time
  - f) exponential

9. Do you think that the lectures are too slow paced, too fast paced, about right? (1 point)

10. Do you think that the problem sets are too easy, too hard, about right? (1 point)
