## Single Period Inventory Models

Yossi Sheffi
Mass Inst of Tech
Cambridge, MA

## Outline

$\square$ Single period inventory decisions
$\square$ Calculating the optimal order size

- Numerically
- Using spreadsheet
$\square$ Using simulation
- Analytically
$\square$ The profit function
- For specific distributions
$\square$ Level of Service
$\square$ Extensions:
- Fixed costs
- Risks
- Initial inventory
- Elastic demand

## Single Period Ordering

## Selling Magazines

$\square$ Weekly demand:

| 90 | 48 | 87 | 78 | 58 | 71 | 102 | 87 | 66 | 79 | 97 | 75 | 89 |
| ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| 57 | 86 | 95 | 67 | 89 | 70 | 113 | 52 | 84 | 62 | 91 | 71 | 66 |
| 99 | 73 | 92 | 66 | 67 | 89 | 87 | 64 | 70 | 54 | 67 | 88 | 62 |
| 79 | 79 | 105 | 76 | 73 | 78 | 50 | 107 | 80 | 78 | 51 | 79 | 80 |

- Total: 4023 magazines
- Average: 77.4 Mag/week
- Min: 51; max: 113 Mag/week

## Detailed Histogram

Average $=77.4 \mathrm{Mag} / \mathrm{wk}$

## Histogram

## The Ordering Decision (Spreadsheet)

$\square$ Assume: each magazine sells for: \$15
$\square$ Cost of each magazine: \$8

| Order: |  | 20 | 30 | 40 | 50 | 60 | 70 | 80 | 90 | 100 | 110 | 120 | 130 | 140 | 150 | 160 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| d/wk | Prob. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 40 | 0.00 | \$140 | \$210 | \$280 | \$200 | \$120 | \$40 | \$40 | \$120 | 200 | 280 |  |  |  |  | 0 |
| 50 | 0.04 | \$140 | \$210 | \$280 | \$350 | \$270 | \$190 | \$110 | \$30 | -\$50 | \$130 | -\$21 | \$29 | -\$370 | \$450 | \$530 |
| 60 | 0.10 | \$140 | \$210 | \$280 | \$350 | \$420 | \$34 | \$260 | \$180 | \$100 | \$20 | -\$ | -\$140 | -\$220 | \$300 | 0 |
| 70 | 0.21 | \$140 | \$210 | \$280 | \$350 | \$420 | \$49 | \$410 | \$330 | \$250 | \$170 | \$90 | \$10 | -\$70 | \$150 | \$230 |
| 80 | 0.29 | \$140 | \$210 | \$280 | \$350 | \$420 | \$49 | \$560 | \$480 | \$400 | \$320 | \$240 | \$160 | \$80 | \$0 | -\$80 |
| 90 | 0.19 | \$140 | \$210 | \$280 | \$350 | \$420 | \$490 | \$560 | \$630 | \$550 | \$470 | \$390 | \$310 | \$230 | \$150 | \$70 |
| 100 | 0.10 | \$140 | \$210 | \$280 | \$350 | \$420 | \$490 | \$560 | \$630 | \$700 | \$620 | \$540 | \$460 | \$380 | \$300 | \$220 |
| 110 | 0.06 | \$140 | \$210 | \$280 | \$350 | \$420 | \$490 | \$560 | \$630 | \$700 | \$770 | \$690 | \$610 | \$530 | \$450 | \$370 |
| 120 | 0.02 | \$140 | \$210 | \$280 | \$350 | \$420 | \$490 | \$560 | \$630 | \$700 | \$770 | \$840 | \$760 | \$680 | \$600 | \$520 |
| 130 | 0.00 | \$140 | \$210 | \$280 | \$350 | \$420 | \$490 | \$560 | \$630 | \$700 | \$770 | \$840 | \$910 | \$830 | \$750 | \$670 |
| Exp. Profit: |  | \$140 | \$210 | \$280 | \$350 | \$414 | \$464 | \$482 | \$457 | \$403 | \$334 | \$257 | \$177 | \$97 | \$17 | -\$63 |

## Expected Profits

## Optimal Order (Anayticial)

$\square$ The optimal order is $\mathrm{Q}^{*}$
$\square$ At Q* - what is the probability of selling one more magazine?
$\square$ The expected profit from ordering the $\left(Q^{*}+1\right)$ st magazine is:
$\square$ The optimum is where the total expected profit from ordering one more magazine is zero:

$$
\operatorname{Pr}\left(\text { Demand } \leq \mathrm{Q}^{*}\right)=\frac{\mathrm{REV}-\mathrm{COST}}{R E V}
$$

## Optimal Order

The "critical ratio":

$$
\operatorname{Pr}\left(\text { Demand } \leq Q^{*}\right)=\frac{R E V-C O S T}{R E V}=\frac{15-8}{15}=0.47
$$

## Salvage Value

 Salvage value $=\$ 4 / \mathrm{Mag} . \quad$ Critcal Ratio $=\frac{R E V-\operatorname{COST}}{R E V-S L V}=\frac{15-8}{15-4}=0.64$

## The Profit Function

$\square$ Revenue from sold items
$\square$ Revenue or costs associated with unsold items. These may include revenue from salvage or cost associated with disposal.
$\square$ Costs associated with not meeting customers' demand. The lost sales cost can include lost of good will and actual penalties for low service.
$\square$ The cost of buying the merchandise in the first place.

## The Profit Function

$$
\begin{aligned}
& E[\text { Sales }]=Q \cdot \int_{x=Q}^{\infty} f(x) d x+\int_{x=0}^{Q} x \cdot f(x) d x \\
& E[\text { Unsold }]=\int_{x=0}^{Q}(Q-x) \cdot f(x) d x=Q-E[\text { Sales }] \\
& E[\text { Lost Sales }]=\int_{x=0}^{\infty}(x-Q) \cdot f(x) d x=\mu-E[\text { Sales }]
\end{aligned}
$$

$$
E[\text { Profit }]=R \cdot E[\text { Sales }]+S \cdot E[\text { Unsold }]-L \cdot E[\text { Lost Sales }]-C \cdot Q
$$

## The Profit Function - Simple Case

$$
E[\text { Profit }]=R \cdot E[\text { Sales }]-C \cdot Q
$$

Optimal Order:

$$
\begin{gathered}
\frac{d}{d Q} E[\text { Profit }]=(1-F(Q)) \cdot R-C=0 \\
\frac{d}{d Q} E[\text { Sales }]=1-F(Q) \\
F\left[Q^{*}\right]=\frac{R-C}{R} \quad \text { and: } \quad Q^{*}=F^{-1}\left[\frac{R-C}{R}\right]
\end{gathered}
$$

## Level of Service

$\square$ Cycle Service - The probability that there will be a stock-out during a cycle
$\square$ Fill Rate - The probability that a specific customer will encounter a stock-out
$\square$

## Level of Service

## Normal Distribution of Demand

$$
\begin{aligned}
& X \sim N(\mu, \sigma) \\
& E[\text { sales }]=Q-\sigma \cdot(z \bullet \Phi(z)+\phi(z)) \quad z=\frac{Q-\mu}{\sigma} \\
& E[\text { Profit }]=(R-C) \bullet Q-R \bullet \sigma \cdot[z \bullet \Phi(z)+\phi(z)]
\end{aligned}
$$

$$
\begin{aligned}
Q^{*}= & \text { NORMINV }\left(\frac{R-C}{R}\right)= \\
& =\text { NORMINV }\left(\frac{15-8}{15}\right)=76 \mathrm{Mags}
\end{aligned}
$$

## Incorporating Fixed Costs

With fixed costs of $\$ 300 /$ order:

## Risk of Loss

## Ordering with Initial Inventory

$\square$ Given initial Inventory: $\mathrm{Q}_{0}$, how to order?
$\square$ Cost of initial inventory
$\square$ With fixed costs, order only if the expected profits from ordering are more than the ordering costs

## Ordering with Fixed <br> Costs and Initial Inventory

Example: $\mathrm{F}=\$ 150$

-If initial inventory is LE 46, order up to 80
-If initial inventory is GE 47, order nothing

## Elastic Demand

$\square \quad \mu=\mathrm{D}(\mathrm{P}) ; \sigma=\mathrm{f}(\mu)$
$\square$ Procedure:

5. Calculate optimal expected profits as a function of $P$.

| Rev $=$ | $\$ 15$ |
| :--- | ---: |
| Cost $=$ | $\$ 8$ |
| $\mu(p)=165-5^{*} \mathrm{p}$ |  |
| $\sigma=$ | $\mu / 2$ |

$\mathrm{P}^{*}=\$ 22$
$\mathrm{Q}^{*}=65 \mathrm{Mag}$
$\mu(\mathrm{p})=56 \mathrm{Mag}$
$\sigma=28$
Exp. Profit=\$543
