Thomas Malthus

**AN ESSAY ON THE PRINCIPLE OF POPULATION, AS IT AFFECTS THE FUTURE IMPROVEMENT OF SOCIETY WITH REMARKS ON THE SPECULATIONS OF MR. GODWIN, M. CONDORCET, AND OTHER WRITERS. (1798)**

**CHAPTER 1**

*Question stated* - *Little prospect of a determination of it, from the enmity of the opposing parties* - *The principal argument against the perfectibility of man and of society has never been fairly answered* - *Nature of the difficulty arising from population* - *Outline of the principal argument of the Essay*

THE great and unlooked for discoveries that have taken place of late years in natural philosophy, the increasing diffusion of general knowledge from the extension of the art of printing, the ardent and unshackled spirit of inquiry that prevails throughout the lettered and even unlettered world, the new and extraordinary lights that have been thrown on political subjects which dazzle and astonish the understanding, and particularly that tremendous phenomenon in the political horizon, the French Revolution, which, like a blazing comet, seems destined either to inspire with fresh life and vigour, or to scorch up and destroy the shrinking inhabitants of the earth, have all concurred to lead many able men into the opinion that we were touching on a period big with the most important changes, changes that would in some measure be decisive of the future fate of mankind.

It has been said that the great question is now at issue, whether man shall henceforth start forwards with accelerated velocity towards illimitable, and hitherto unconceived improvement, or be condemned to a perpetual oscillation between happiness and misery, and after every effort remain still at an immeasurable distance from the wished-for goal.

Yet, anxiously as every friend of mankind must look forwards to the termination of this painful suspense, and eagerly as the inquiring mind would hail every ray of light that might assist its view into futurity, it is much to be lamented that the writers on each side of this momentous question still keep far aloof from each other. Their mutual arguments do not meet with a candid examination. The question is not brought to rest on fewer points, and even in theory scarcely seems to be approaching to a decision.

The advocate for the present order of things is apt to treat the sect of speculative philosophers either as a set of artful and designing knaves who preach up ardent benevolence and draw captivating pictures of a happier state of society only the better to enable them to destroy the present establishments and to forward their own deep-laid schemes of ambition, or as wild and mad-headed enthusiasts whose silly speculations and absurd paradoxes are not worthy the attention of any reasonable man.

The advocate for the perfectibility of man, and of society, retorts on the defender of establishments a more than equal contempt. He brands him as the slave
of the most miserable and narrow prejudices; or as the defender of the abuses of civil society only because he profits by them. He paints him either as a character who prostitutes his understanding to his interest, or as one whose powers of mind are not of a size to grasp any thing great and noble, who cannot see above five yards before him, and who must therefore be utterly unable to take in the views of the enlightened benefactor of mankind.

In this unamicable contest the cause of truth cannot but suffer. The really good arguments on each side of the question are not allowed to have their proper weight. Each pursues his own theory, little solicitous to correct or improve it by an attention to what is advanced by his opponents.

The friend of the present order of things condemns all political speculations in the gross. He will not even condescend to examine the grounds from which the perfectibility of society is inferred. Much less will he give himself the trouble in a fair and candid manner to attempt an exposition of their fallacy.

The speculative philosopher equally offends against the cause of truth. With eyes fixed on a happier state of society, the blessings of which he paints in the most captivating colours, he allows himself to indulge in the most bitter invectives against every present establishment, without applying his talents to consider the best and safest means of removing abuses and without seeming to be aware of the tremendous obstacles that threaten, even in theory, to oppose the progress of man towards perfection.

It is an acknowledged truth in philosophy that a just theory will always be confirmed by experiment. Yet so much friction, and so many minute circumstances occur in practice, which it is next to impossible for the most enlarged and penetrating mind to foresee, that on few subjects can any theory be pronounced just, till all the arguments against it have been maturely weighed and clearly and consistently refuted.

I have read some of the speculations on the perfectibility of man and of society with great pleasure. I have been warmed and delighted with the enchanting picture which they hold forth. I ardently wish for such happy improvements. But I see great, and, to my understanding, unconquerable difficulties in the way to them. These difficulties it is my present purpose to state, declaring, at the same time, that so far from exulting in them, as a cause of triumph over the friends of innovation, nothing would give me greater pleasure than to see them completely removed.

The most important argument that I shall adduce is certainly not new. The principles on which it depends have been explained in part by Hume, and more at large by Dr Adam Smith. It has been advanced and applied to the present subject, though not with its proper weight, or in the most forcible point of view, by Mr Wallace, and it may probably have been stated by many writers that I have never met with. I should certainly therefore not think of advancing it again, though I mean to place it in a point of view in some degree different from any that I have hitherto seen, if it had ever been fairly and satisfactorily answered.

The cause of this neglect on the part of the advocates for the perfectibility of mankind is not easily accounted for. I cannot doubt the talents of such men as Godwin and Condorcet. I am unwilling to doubt their candour. To my understanding, and probably to that of most others, the difficulty appears insurmountable. Yet these men of acknowledged ability and penetration scarcely deign to notice it, and hold on their course in such speculations with unabated
ardour and undiminished confidence. I have certainly no right to say that they purposely shut their eyes to such arguments. I ought rather to doubt the validity of them, when neglected by such men, however forcibly their truth may strike my own mind. Yet in this respect it must be acknowledged that we are all of us too prone to err. If I saw a glass of wine repeatedly presented to a man, and he took no notice of it, I should be apt to think that he was blind or uncivil. A juster philosophy might teach me rather to think that my eyes deceived me and that the offer was not really what I conceived it to be.

In entering upon the argument I must premise that I put out of the question, at present, all mere conjectures, that is, all suppositions, the probable realization of which cannot be inferred upon any just philosophical grounds. A writer may tell me that he thinks man will ultimately become an ostrich. I cannot properly contradict him. But before he can expect to bring any reasonable person over to his opinion, he ought to show that the necks of mankind have been gradually elongating, that the lips have grown harder and more prominent, that the legs and feet are daily altering their shape, and that the hair is beginning to change into stubs of feathers. And till the probability of so wonderful a conversion can be shown, it is surely lost time and lost eloquence to expatiate on the happiness of man in such a state; to describe his powers, both of running and flying, to paint him in a condition where all narrow luxuries would be contemned, where he would be employed only in collecting the necessaries of life, and where, consequently, each man's share of labour would be light, and his portion of leisure ample.

I think I may fairly make two postulates.

First, That food is necessary to the existence of man.

Secondly, That the passion between the sexes is necessary and will remain nearly in its present state.

These two laws, ever since we have had any knowledge of mankind, appear to have been fixed laws of our nature, and, as we have not hitherto seen any alteration in them, we have no right to conclude that they will ever cease to be what they now are, without an immediate act of power in that Being who first arranged the system of the universe, and for the advantage of his creatures, still executes, according to fixed laws, all its various operations.

I do not know that any writer has supposed that on this earth man will ultimately be able to live without food. But Mr Godwin has conjectured that the passion between the sexes may in time be extinguished. As, however, he calls this part of his work a deviation into the land of conjecture, I will not dwell longer upon it at present than to say that the best arguments for the perfectibility of man are drawn from a contemplation of the great progress that he has already made from the savage state and the difficulty of saying where he is to stop. But towards the extinction of the passion between the sexes, no progress whatever has hitherto been made. It appears to exist in as much force at present as it did two thousand or four thousand years ago. There are individual exceptions now as there always have been. But, as these exceptions do not appear to increase in number, it would surely be a very unphilosophical mode of arguing to infer, merely from the existence of an exception, that the exception would, in time, become the rule, and the rule the exception.

Assuming then my postulates as granted, I say, that the power of population is indefinitely greater than the power in the earth to produce subsistence for man.
Population, when unchecked, increases in a geometrical ratio. Subsistence increases only in an arithmetical ratio. A slight acquaintance with numbers will show the immensity of the first power in comparison of the second.

By that law of our nature which makes food necessary to the life of man, the effects of these two unequal powers must be kept equal.

This implies a strong and constantly operating check on population from the difficulty of subsistence. This difficulty must fall somewhere and must necessarily be severely felt by a large portion of mankind.

Through the animal and vegetable kingdoms, nature has scattered the seeds of life abroad with the most profuse and liberal hand. She has been comparatively sparing in the room and the nourishment necessary to rear them. The germs of existence contained in this spot of earth, with ample food, and ample room to expand in, would fill millions of worlds in the course of a few thousand years. Necessity, that imperious all pervading law of nature, restrains them within the prescribed bounds. The race of plants and the race of animals shrink under this great restrictive law. And the race of man cannot, by any efforts of reason, escape from it. Among plants and animals its effects are waste of seed, sickness, and premature death. Among mankind, misery and vice. The former, misery, is an absolutely necessary consequence of it. Vice is a highly probable consequence, and we therefore see it abundantly prevail, but it ought not, perhaps, to be called an absolutely necessary consequence. The ordeal of virtue is to resist all temptation to evil.

This natural inequality of the two powers of population and of production in the earth, and that great law of our nature which must constantly keep their effects equal, form the great difficulty that to me appears insurmountable in the way to the perfectibility of society. All other arguments are of slight and subordinate consideration in comparison of this. I see no way by which man can escape from the weight of this law which pervades all animated nature. No fancied equality, no agrarian regulations in their utmost extent, could remove the pressure of it even for a single century. And it appears, therefore, to be decisive against the possible existence of a society, all the members of which should live in ease, happiness, and comparative leisure; and feel no anxiety about providing the means of subsistence for themselves and families.

Consequently, if the premises are just, the argument is conclusive against the perfectibility of the mass of mankind.

I have thus sketched the general outline of the argument, but I will examine it more particularly, and I think it will be found that experience, the true source and foundation of all knowledge, invariably confirms its truth.

CHAPTER 2
The different ratio in which population and food increase - The necessary effects of these different ratios of increase - Oscillation produced by them in the condition of the lower classes of society - Reasons why this oscillation has not been so much observed as might be expected - Three propositions on which the general argument of the Essay depends -- The different states in which mankind have been known to exist proposed to be examined with reference to these three propositions.
I SAID that population, when unchecked, increased in a geometrical ratio, and subsistence for man in an arithmetical ratio.

Let us examine whether this position be just. I think it will be allowed, that no state has hitherto existed (at least that we have any account of) where the manners were so pure and simple, and the means of subsistence so abundant, that no check whatever has existed to early marriages, among the lower classes, from a fear of not providing well for their families, or among the higher classes, from a fear of lowering their condition in life. Consequently in no state that we have yet known has the power of population been left to exert itself with perfect freedom.

Whether the law of marriage be instituted or not, the dictate of nature and virtue seems to be an early attachment to one woman. Supposing a liberty of changing in the case of an unfortunate choice, this liberty would not affect population till it arose to a height greatly vicious; and we are now supposing the existence of a society where vice is scarcely known.

In a state therefore of great equality and virtue, where pure and simple manners prevailed, and where the means of subsistence were so abundant that no part of the society could have any fears about providing amply for a family, the power of population being left to exert itself unchecked, the increase of the human species would evidently be much greater than any increase that has been hitherto known.

In the United States of America, where the means of subsistence have been more ample, the manners of the people more pure, and consequently the checks to early marriages fewer, than in any of the modern states of Europe, the population has been found to double itself in twenty-five years.

This ratio of increase, though short of the utmost power of population, yet as the result of actual experience, we will take as our rule, and say, that population, when unchecked, goes on doubling itself every twenty-five years or increases in a geometrical ratio.

Let us now take any spot of earth, this Island for instance, and see in what ratio the subsistence it affords can be supposed to increase. We will begin with it under its present state of cultivation.

If I allow that by the best possible policy, by breaking up more land and by great encouragements to agriculture, the produce of this Island may be doubled in the first twenty-five years, I think it will be allowing as much as any person can well demand.

In the next twenty-five years, it is impossible to suppose that the produce could be quadrupled. It would be contrary to all our knowledge of the qualities of land. The very utmost that we can conceive, is, that the increase in the second twenty-five years might equal the present produce. Let us then take this for our rule, though certainly far beyond the truth, and allow that, by great exertion, the whole produce of the Island might be increased every twenty-five years, by a quantity of subsistence equal to what it at present produces. The most enthusiastic speculator cannot suppose a greater increase than this. In a few centuries it would make every acre of land in the Island like a garden.

Yet this ratio of increase is evidently arithmetical.

It may be fairly said, therefore, that the means of subsistence increase in an arithmetical ratio. Let us now bring the effects of these two ratios together.
The population of the Island is computed to be about seven millions, and we will suppose the present produce equal to the support of such a number. In the first twenty-five years the population would be fourteen millions, and the food being also doubled, the means of subsistence would be equal to this increase. In the next twenty-five years the population would be twenty-eight millions, and the means of subsistence only equal to the support of twenty-one millions. In the next period, the population would be fifty-six millions, and the means of subsistence just sufficient for half that number. And at the conclusion of the first century the population would be one hundred and twelve millions and the means of subsistence only equal to the support of thirty-five millions, which would leave a population of seventy-seven millions totally unprovided for.

A great emigration necessarily implies unhappiness of some kind or other in the country that is deserted. For few persons will leave their families, connections, friends, and native land, to seek a settlement in untried foreign climes, without some strong subsisting causes of uneasiness where they are, or the hope of some great advantages in the place to which they are going.

But to make the argument more general and less interrupted by the partial views of emigration, let us take the whole earth, instead of one spot, and suppose that the restraints to population were universally removed. If the subsistence for man that the earth affords was to be increased every twenty-five years by a quantity equal to what the whole world at present produces, this would allow the power of production in the earth to be absolutely unlimited, and its ratio of increase much greater than we can conceive that any possible exertions of mankind could make it.

Taking the population of the world at any number, a thousand millions, for instance, the human species would increase in the ratio of -- 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, etc. and subsistence as -- 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, etc. In two centuries and a quarter, the population would be to the means of subsistence as 512 to 10: in three centuries as 4096 to 13, and in two thousand years the difference would be almost incalculable, though the produce in that time would have increased to an immense extent.

No limits whatever are placed to the productions of the earth; they may increase for ever and be greater than any assignable quantity. yet still the power of population being a power of a superior order, the increase of the human species can only be kept commensurate to the increase of the means of subsistence by the constant operation of the strong law of necessity acting as a check upon the greater power.

The effects of this check remain now to be considered.

Among plants and animals the view of the subject is simple. They are all impelled by a powerful instinct to the increase of their species, and this instinct is interrupted by no reasoning or doubts about providing for their offspring. Wherever therefore there is liberty, the power of increase is exerted, and the superabundant effects are repressed afterwards by want of room and nourishment, which is common to animals and plants, and among animals by becoming the prey of others.

The effects of this check on man are more complicated. Impelled to the increase of his species by an equally powerful instinct, reason interrupts his career and asks him whether he may not bring beings into the world for whom he cannot provide the means of subsistence. In a state of equality, this would be the simple
question. In the present state of society, other considerations occur. Will he not lower his rank in life? Will he not subject himself to greater difficulties than he at present feels? Will he not be obliged to labour harder? and if he has a large family, will his utmost exertions enable him to support them? May he not see his offspring in rags and misery, and clamouring for bread that he cannot give them? And may he not be reduced to the grating necessity of forfeiting his independence, and of being obliged to the sparing hand of charity for support?

These considerations are calculated to prevent, and certainly do prevent, a very great number in all civilized nations from pursuing the dictate of nature in an early attachment to one woman. And this restraint almost necessarily, though not absolutely so, produces vice. Yet in all societies, even those that are most vicious, the tendency to a virtuous attachment is so strong that there is a constant effort towards an increase of population. This constant effort as constantly tends to subject the lower classes of the society to distress and to prevent any great permanent amelioration of their condition.

The way in which these effects are produced seems to be this. We will suppose the means of subsistence in any country just equal to the easy support of its inhabitants. The constant effort towards population, which is found to act even in the most vicious societies, increases the number of people before the means of subsistence are increased. The food therefore which before supported seven millions must now be divided among seven millions and a half or eight millions. The poor consequently must live much worse, and many of them be reduced to severe distress. The number of labourers also being above the proportion of the work in the market, the price of labour must tend toward a decrease, while the price of provisions would at the same time tend to rise. The labourer therefore must work harder to earn the same as he did before. During this season of distress, the discouragements to marriage, and the difficulty of rearing a family are so great that population is at a stand. In the mean time the cheapness of labour, the plenty of labourers, and the necessity of an increased industry amongst them, encourage cultivators to employ more labour upon their land, to turn up fresh soil, and to manure and improve more completely what is already in tillage, till ultimately the means of subsistence become in the same proportion to the population as at the period from which we set out. The situation of the labourer being then again tolerably comfortable, the restraints to population are in some degree loosened, and the same retrograde and progressive movements with respect to happiness are repeated.

This sort of oscillation will not be remarked by superficial observers, and it may be difficult even for the most penetrating mind to calculate its periods. Yet that in all old states some such vibration does exist, though from various transverse causes, in a much less marked, and in a much more irregular manner than I have described it, no reflecting man who considers the subject deeply can well doubt.

Many reasons occur why this oscillation has been less obvious, and less decidedly confirmed by experience, than might naturally be expected.

One principal reason is that the histories of mankind that we possess are histories only of the higher classes. We have but few accounts that can be depended upon of the manners and customs of that part of mankind where these retrograde and progressive movements chiefly take place. A satisfactory history of this kind, on one people, and of one period, would require the constant and minute attention of
an observing mind during a long life. Some of the objects of inquiry would be, in what proportion to the number of adults was the number of marriages, to what extent vicious customs prevailed in consequence of the restraints upon matrimony, what was the comparative mortality among the children of the most distressed part of the community and those who lived rather more at their ease, what were the variations in the real price of labour, and what were the observable differences in the state of the lower classes of society with respect to ease and happiness, at different times during a certain period.

Such a history would tend greatly to elucidate the manner in which the constant check upon population acts and would probably prove the existence of the retrograde and progressive movements that have been mentioned, though the times of their vibrations must necessarily be rendered irregular from the operation of many interrupting causes, such as the introduction or failure of certain manufactures, a greater or less prevalent spirit of agricultural enterprise, years of plenty, or years of scarcity, wars and pestilence, poor laws, the invention of processes for shortening labour without the proportional extension of the market for the commodity, and, particularly, the difference between the nominal and real price of labour, a circumstance which has perhaps more than any other contributed to conceal this oscillation from common view.

It very rarely happens that the nominal price of labour universally falls, but we well know that it frequently remains the same, while the nominal price of provisions has been gradually increasing. This is, in effect, a real fall in the price of labour, and during this period the condition of the lower orders of the community must gradually grow worse and worse. But the farmers and capitalists are growing rich from the real cheapness of labour. Their increased capitals enable them to employ a greater number of men. Work therefore may be plentiful, and the price of labour would consequently rise. But the want of freedom in the market of labour, which occurs more or less in all communities, either from parish laws, or the more general cause of the facility of combination among the rich, and its difficulty among the poor, operates to prevent the price of labour from rising at the natural period, and keeps it down some time longer; perhaps till a year of scarcity, when the clamour is too loud and the necessity too apparent to be resisted.

The true cause of the advance in the price of labour is thus concealed, and the rich affect to grant it as an act of compassion and favour to the poor, in consideration of a year of scarcity, and, when plenty returns, indulge themselves in the most unreasonable of all complaints, that the price does not again fall, when a little rejection would show them that it must have risen long before but from an unjust conspiracy of their own.

But though the rich by unfair combinations contribute frequently to prolong a season of distress among the poor, yet no possible form of society could prevent the almost constant action of misery upon a great part of mankind, if in a state of inequality, and upon all, if all were equal.

The theory on which the truth of this position depends appears to me so extremely clear that I feel at a loss to conjecture what part of it can be denied.

That population cannot increase without the means of subsistence is a proposition so evident that it needs no illustration.
That population does invariably increase where there are the means of subsistence, the history of every people that have ever existed will abundantly prove.

And that the superior power of population cannot be checked without producing misery or vice, the ample portion of these too bitter ingredients in the cup of human life and the continuance of the physical causes that seem to have produced them bear too convincing a testimony.

But, in order more fully to ascertain the validity of these three propositions, let us examine the different states in which mankind have been known to exist. Even a cursory review will, I think, be sufficient to convince us that these propositions are incontrovertible truths.

CHAPTER 3

The savage or hunter state shortly reviewed - The shepherd state, or the tribes of barbarians that overran the Roman Empire - The superiority of the power of population to the means of subsistence - the cause of the great tide of Northern Emigration.

IN the rudest state of mankind, in which hunting is the principal occupation, and the only mode of acquiring food, the means of subsistence being scattered over a large extent of territory, the comparative population must necessarily be thin. It is said that the passion between the sexes is less ardent among the North American Indians than among any other race of men. Yet, notwithstanding this apathy, the effort towards population, even in this people, seems to be always greater than the means to support it. This appears from the comparatively rapid population that takes place whenever any of the tribes happen to settle in some fertile spot and to draw nourishment from more fruitful sources than that of hunting, and it has been frequently remarked that when an Indian family has taken up its abode near any European settlement and adopted a more easy and civilized mode of life, that one woman has reared five, or six, or more children, though in the savage state it rarely happens that above one or two in a family grow up to maturity. The same observation has been made with regard to the Hottentots near the Cape. These facts prove the superior power of population to the means of subsistence in nations of hunters, and that this power always shows itself the moment it is left to act with freedom.

It remains to inquire whether this power can be checked, and its effects kept equal to the means of subsistence, without vice or misery.

May we not fairly infer from the accounts that may be referred to of nations of hunters, that their population is thin from the scarcity of food, that it would immediately increase if food was in greater plenty, and that, putting vice out of the question among savages, misery is the check that represses the superior power of population and keeps its effects equal to the means of subsistence. Actual observation and experience tell us that this check, with a few local and temporary exceptions, is constantly acting now upon all savage nations, and the theory indicates that it probably acted with nearly equal strength a thousand years ago, and it may not be much greater a thousand years hence.

Of the manners and habits that prevail among nations of shepherds, the next state of mankind, we are even more ignorant than of the savage state. But that
these nations could not escape the general lot of misery arising from the want of subsistence, Europe, and all the fairest countries in the world, bear ample testimony. . . . It is well known that a country in pasture cannot support so many inhabitants as a country in tillage, but what renders nations of shepherds so formidable is the power which they possess of moving all together and the necessity they frequently feel of exerting this power in search of fresh pasture for their herds. A tribe that was rich in cattle had an immediate plenty of food. Even the parent stock might be devoured in a case of absolute necessity. The women lived in greater ease than among nations of hunters. The men bold in their united strength and confiding in their power of procuring pasture for their cattle by change of place, felt, probably, but few fears about providing for a family. These combined causes soon produced their natural and invariable effect, an extended population. A more frequent and rapid change of place became then necessary. A wider and more extensive territory was successively occupied. A broader desolation extended all around them. Want pinched the less fortunate members of the society, and, at length, the impossibility of supporting such a number together became too evident to be resisted. Young scions were then pushed out from the parent-stock and instructed to explore fresh regions and to gain happier seats for themselves by their swords. ‘The world was all before them where to choose.’ [Milton] Restless from present distress, flushed with the hope of fairer prospects, and animated with the spirit of hardy enterprise, these daring adventurers were likely to become formidable adversaries to all who opposed them. The peaceful inhabitants of the countries on which they rushed could not long withstand the energy of men acting under such powerful motives of exertion. And when they fell in with any tribes like their own, the contest was a struggle for existence, and they fought with a desperate courage, inspired by the reflection that death was the punishment of defeat and life the prize of victory.

. . . Among these bold and improvident Barbarians, population was probably but little checked, as in modern states, from a fear of future difficulties. A prevailing hope of bettering their condition by change of place, a constant expectation of plunder, a power even, if distressed, of selling their children as slaves, added to the natural carelessness of the barbaric character, all conspired to raise a population which remained to be repressed afterwards by famine or war. Where there is any inequality of conditions, and among nations of shepherds this soon takes place, the distress arising from a scarcity of provisions must fall hardest upon the least fortunate members of the society. This distress also must frequently have been felt by the women, exposed to casual plunder in the absence of their husbands, and subject to continual disappointments in their expected return.

But without knowing enough of the minute and intimate history of these people, to point out precisely on what part the distress for want of food chiefly fell, and to what extent it was generally felt, I think we may fairly say, from all the accounts that we have of nations of shepherds, that population invariably increased among them whenever, by emigration or any other cause, the means of subsistence were increased, and that a further population was checked, and the actual population kept equal to the means of subsistence, by misery and vice.

For, independently of any vicious customs that might have prevailed amongst them with regard to women, which always operate as checks to population, it must
be acknowledged, I think, that the commission of war is vice, and the effect of it misery, and none can doubt the misery of want of food.

CHAPTER 4
State of civilized nations - Probability that Europe is much more populous now than in the time of Julius Caesar - Best criterion of population - Probable error of Hume in one the criterions that he proposes as assisting in an estimate of population - Slow increase of population at present in most of the states of Europe - The two principal checks to population - The first, or preventive check examined with regard to England.

IN examining the next state of mankind with relation to the question before us, the state of mixed pasture and tillage, in which with some variation in the proportions the most civilized nations must always remain, we shall be assisted in our review by what we daily see around us, by actual experience, by facts that come within the scope of every man's observation.

Notwithstanding the exaggerations of some old historians, there can remain no doubt in the mind of any thinking man that the population of the principal countries of Europe, France, England, Germany, Russia, Poland, Sweden, and Denmark is much greater than ever it was in former times. The obvious reason of these exaggerations is the formidable aspect that even a thinly peopled nation must have, when collected together and moving all at once in search of fresh seats. If to this tremendous appearance be added a succession at certain intervals of similar emigrations, we shall not be much surprised that the fears of the timid nations of the South represented the North as a region absolutely swarming with human beings. A nearer and juster view of the subject at present enables us to see that the inference was as absurd as if a man in this country, who was continually meeting on the road droves of cattle from Wales and the North, was immediately to conclude that these countries were the most productive of all the parts of the kingdom.

The reason that the greater part of Europe is more populous now than it was in former times, is that the industry of the inhabitants has made these countries produce a greater quantity of human subsistence. For I conceive that it may be laid down as a position not to be controverted, that, taking a sufficient extent of territory to include within it exportation and importation, and allowing some variation for the prevalence of luxury, or of frugal habits, that population constantly bears a regular proportion to the food that the earth is made to produce. In the controversy concerning the populousness of ancient and modern nations, could it be clearly ascertained that the average produce of the countries in question, taken altogether, is greater now than it was in the times of Julius Caesar, the dispute would be at once determined.

In examining the principal states of modern Europe, we shall find that though they have increased very considerably in population since they were nations of shepherds, yet that at present their progress is but slow, and instead of doubling their numbers every twenty-five years they require three or four hundred years, or more, for that purpose. Some, indeed, may be absolutely stationary, and others even retrograde. The cause of this slow progress in population cannot be traced to a decay of the passion between the sexes. We have sufficient reason to think that this natural propensity exists still in undiminished vigour. Why then do not its effects
appear in a rapid increase of the human species? An intimate view of the state of
society in any one country in Europe, which may serve equally for all, will enable us
to answer this question, and to say that a foresight of the difficulties attending the
rearing of a family acts as a preventive check, and the actual distresses of some of
the lower classes, by which they are disabled from giving the proper food and
attention to their children, act as a positive check to the natural increase of
population.

England, as one of the most flourishing states of Europe, may be fairly taken
for an example, and the observations made will apply with but little variation to
any other country where the population increases slowly.

The preventive check appears to operate in some degree through all the ranks
of society in England. There are some men, even in the highest rank, who are
prevented from marrying by the idea of the expenses that they must retrench, and
the fancied pleasures that they must deprive themselves of, on the supposition of
having a family. These considerations are certainly trivial, but a preventive foresight
of this kind has objects of much greater weight for its contemplation as we go lower.

A man of liberal education, but with an income only just sufficient to enable
him to associate in the rank of gentlemen, must feel absolutely certain that if he
marries and has a family he shall be obliged, if he mixes at all in society, to rank
himself with moderate farmers and the lower class of tradesmen. The woman that a
man of education would naturally make the object of his choice would be one
brought up in the same tastes and sentiments with himself and used to the familiar
intercourse of a society totally different from that to which she must be reduced by
marriage. Can a man consent to place the object of his affection in a situation so
discordant, probably, to her tastes and inclinations? Two or three steps of descent in
society, particularly at this round of the ladder, where education ends and ignorance
begins, will not be considered by the generality of people as a fancied and
chimerical, but a real and essential evil. If society be held desirable, it surely must
be free, equal, and reciprocal society, where benefits are conferred as well as
received, and not such as the dependent finds with his patron or the poor with the
rich.

These considerations undoubtedly prevent a great number in this rank of life
from following the bent of their inclinations in an early attachment. Others, guided
either by a stronger passion, or a weaker judgement, break through these restraints,
and it would be hard indeed, if the gratification of so delightful a passion as virtuous
love, did not, sometimes, more than counterbalance all its attendant evils. But I fear
it must be owned that the more general consequences of such marriages are rather
calculated to justify than to repress the forebodings of the prudent.

The sons of tradesmen and farmers are exhorted not to marry, and generally
find it necessary to pursue this advice till they are settled in some business or farm
that may enable them to support a family. These events may not, perhaps, occur till
they are far advanced in life. The scarcity of farms is a very general complaint in
England. And the competition in every kind of business is so great that it is not
possible that all should be successful.

The labourer who earns eighteen pence a day and lives with some degree of
comfort as a single man, will hesitate a little before he divides that pittance among
four or five, which seems to be but just sufficient for one. Harder fare and harder
labour he would submit to for the sake of living with the woman that he loves, but
he must feel conscious, if he thinks at all, that should he have a large family, and
any ill luck whatever, no degree of frugality, no possible exertion of his manual
strength could preserve him from the heart-rending sensation of seeing his children
starve, or of forfeiting his independence, and being obliged to the parish for their
support. The love of independence is a sentiment that surely none would wish to be
erased from the breast of man, though the parish law of England, it must be
confessed, is a system of all others the most calculated gradually to weaken this
sentiment, and in the end may eradicate it completely.

The servants who live in gentlemen's families have restraints that are yet
stronger to break through in venturing upon marriage. They possess the necessaries,
and even the comforts of life, almost in as great plenty as their masters. Their work
is easy and their food luxurious compared with the class of labourers. And their
sense of dependence is weakened by the conscious power of changing their masters,
if they feel themselves offended. Thus comfortably situated at present, what are
their prospects in marrying? Without knowledge or capital, either for business, or
farming, and unused and therefore unable, to earn a subsistence by daily labour,
their only refuge seems to be a miserable alehouse, which certainly offers no very
enchanting prospect of a happy evening to their lives. By much the greater part,
therefore, deterred by this uninviting view of their future situation, content
themselves with remaining single where they are.

If this sketch of the state of society in England be near the truth, and I do
not conceive that it is exaggerated, it will be allowed that the preventive check to
population in this country operates, though with varied force, through all the classes
of the community. The same observation will hold true with regard to all old states.
The effects, indeed, of these restraints upon marriage are but too conspicuous in the
consequent vices that are produced in almost every part of the world, vices that are
continually involving both sexes in inextricable unhappiness.

CHAPTER 5
The second, or positive check to population examined, in England - The true cause
why th immense sum collected in England for the poor does not better their
condition - The powerful tendency of the poor laws to defeat their own purpose -
Palliative of the distresses of the poor proposed - The absolute impossibility, from
the fixed laws of our nature, that the pressure of want can ever be completely
removed from the lower classes of society - All the checks to population may be
resolved into misery or vice.

THE positive check to population, by which I mean the check that represses
an increase which is already begun, is confined chiefly, though not perhaps solely, to
the lowest orders of society.

This check is not so obvious to common view as the other I have mentioned, and, to
prove distinctly the force and extent of its operation would require, perhaps, more
data than we are in possession of. But I believe it has been very generally remarked
by those who have attended to bills of mortality that of the number of children who
die annually, much too great a proportion belongs to those who may be supposed
unable to give their offspring proper food and attention, exposed as they are
occasionally to severe distress and confined, perhaps, to unwholesome habitations.
and hard labour. This mortality among the children of the poor has been constantly taken notice of in all towns. It certainly does not prevail in an equal degree in the country, but the subject has not hitherto received sufficient attention to enable anyone to say that there are not more deaths in proportion among the children of the poor, even in the country, than among those of the middling and higher classes. Indeed, it seems difficult to suppose that a labourer’s wife who has six children, and who is sometimes in absolute want of bread, should be able always to give them the food and attention necessary to support life. The sons and daughters of peasants will not be found such rosy cherubs in real life as they are described to be in romances. It cannot fail to be remarked by those who live much in the country that the sons of labourers are very apt to be stunted in their growth, and are a long while arriving at maturity. Boys that you would guess to be fourteen or fifteen are, upon inquiry, frequently found to be eighteen or nineteen. And the lads who drive plough, which must certainly be a healthy exercise, are very rarely seen with any appearance of calves to their legs: a circumstance which can only be attributed to a want either of proper or of sufficient nourishment.

To remedy the frequent distresses of the common people, the poor laws of England have been instituted; but it is to be feared, that though they may have alleviated a little the intensity of individual misfortune, they have spread the general evil over a much larger surface. It is a subject often started in conversation and mentioned always as a matter of great surprise that, notwithstanding the immense sum that is annually collected for the poor in England, there is still so much distress among them. Some think that the money must be embezzled, others that the church-wardens and overseers consume the greater part of it in dinners. All agree that somehow or other it must be very ill-managed. In short the fact that nearly three millions are collected annually for the poor and yet that their distresses are not removed is the subject of continual astonishment. But a man who sees a little below the surface of things would be very much more astonished if the fact were otherwise than it is observed to be, or even if a collection universally of eighteen shillings in the pound, instead of four, were materially to alter it. I will state a case which I hope will elucidate my meaning.

Suppose that by a subscription of the rich the eighteen pence a day which men earn now was made up five shillings, it might be imagined, perhaps, that they would then be able to live comfortably and have a piece of meat every day for their dinners. But this would be a very false conclusion. The transfer of three shillings and sixpence a day to every labourer would not increase the quantity of meat in the country. There is not at present enough for all to have a decent share. What would then be the consequence? The competition among the buyers in the market of meat would rapidly raise the price from sixpence or sevenpence, to two or three shillings in the pound, and the commodity would not be divided among many more than it is at present. When an article is scarce, and cannot be distributed to all, he that can show the most valid patent, that is, he that offers most money, becomes the possessor. If we can suppose the competition among the buyers of meat to continue long enough for a greater number of cattle to be reared annually, this could only be done at the expense of the corn, which would be a very disadvantageous exchange, for it is well known that the country could not then support the same population, and when subsistence is scarce in proportion to the number of people, it is of little consequence whether the lowest members of the society possess eighteen pence or
five shillings. They must at all events be reduced to live upon the hardest fare and in the smallest quantity.

It will be said, perhaps, that the increased number of purchasers in every article would give a spur to productive industry and that the whole produce of the island would be increased. This might in some degree be the case. But the spur that these fancied riches would give to population would more than counterbalance it, and the increased produce would be to be divided among a more than proportionally increased number of people. All this time I am supposing that the same quantity of work would be done as before. But this would not really take place. The receipt of five shillings a day, instead of eighteen pence, would make every man fancy himself comparatively rich and able to indulge himself in many hours or days of leisure. This would give a strong and immediate check to productive industry, and, in a short time, not only the nation would be poorer, but the lower classes themselves would be much more distressed than when they received only eighteen pence a day.

A collection from the rich of eighteen shillings in the pound, even if distributed in the most judicious manner, would have a little the same effect as that resulting from the supposition I have just made, and no possible contributions or sacrifices of the rich, particularly in money, could for any time prevent the recurrence of distress among the lower members of society, whoever they were. Great changes might, indeed, be made. The rich might become poor, and some of the poor rich, but a part of the society must necessarily feel a difficulty of living, and this difficulty will naturally fall on the least fortunate members.

It may at first appear strange, but I believe it is true, that I cannot by means of money raise a poor man and enable him to live much better than he did before, without proportionally depressing others in the same class. If I retrench the quantity of food consumed in my house, and give him what I have cut off, I then benefit him, without depressing any but myself and family, who, perhaps, may be well able to bear it. If I turn up a piece of uncultivated land, and give him the produce, I then benefit both him and all the members of the society, because what he before consumed is thrown into the common stock, and probably some of the new produce with it. But if I only give him money, supposing the produce of the country to remain the same, I give him a title to a larger share of that produce than formerly, which share he cannot receive without diminishing the shares of others. It is evident that this effect, in individual instances, must be so small as to be totally imperceptible; but still it must exist, as many other effects do, which, like some of the insects that people the air, elude our grosser perceptions.

Supposing the quantity of food in any country to remain the same for many years together, it is evident that this food must be divided according to the value of each man’s patent, or the sum of money that he can afford to spend on this commodity so universally in request. (Mr Godwin calls the wealth that a man receives from his ancestors a mouldy patent. It may, I think, very properly be termed a patent, but I hardly see the propriety of calling it a mouldy one, as it is an article in such constant use.) It is a demonstrative truth, therefore, that the patents of one set of men could not be increased in value without diminishing the value of the patents of some other set of men. If the rich were to subscribe and give five shillings a day to five hundred thousand men without retrenching their own tables, no doubt can exist, that as these men would naturally live more at their ease and
consume a greater quantity of provisions, there would be less food remaining to
divide among the rest, and consequently each man's patent would be diminished in
value or the same number of pieces of silver would purchase a smaller quantity of
subsistence.

An increase of population without a proportional increase of food will
evidently have the same effect in lowering the value of each man's patent. The food
must necessarily be distributed in smaller quantities, and consequently a day's
labour will purchase a smaller quantity of provisions. An increase in the price of
provisions would arise either from an increase of population faster than the means of
subsistence, or from a different distribution of the money of the society. The food of
a country that has been long occupied, if it be increasing, increases slowly and
regularly and cannot be made to answer any sudden demands, but variations in the
distribution of the money of a society are not infrequently occurring, and are
undoubtedly among the causes that occasion the continual variations which we
observe in the price of provisions.

The poor laws of England tend to depress the general condition of the poor in
these two ways. Their first obvious tendency is to increase population without
increasing the food for its support. A poor man may marry with little or no prospect
of being able to support a family in independence. They may be said therefore in
some measure to create the poor which they maintain, and as the provisions of the
country must, in consequence of the increased population, be distributed to every
man in smaller proportions, it is evident that the labour of those who are not
supported by parish assistance will purchase a smaller quantity of provisions than
before and consequently more of them must be driven to ask for support.

Secondly, the quantity of provisions consumed in workhouses upon a part of
the society that cannot in general be considered as the most valuable part
diminishes the shares that would otherwise belong to more industrious and more
worthy members, and thus in the same manner forces more to become dependent. If
the poor in the workhouses were to live better than they now do, this new
distribution of the money of the society would tend more conspicuously to depress
the condition of those out of the workhouses by occasioning a rise in the price of
provisions.

Fortunately for England, a spirit of independence still remains among the
peasantry. The poor laws are strongly calculated to eradicate this spirit. They have
succeeded in part, but had they succeeded as completely as might have been
expected their pernicious tendency would not have been so long concealed.

Hard as it may appear in individual instances, dependent poverty ought to be
held disgraceful. Such a stimulus seems to be absolutely necessary to promote the
happiness of the great mass of mankind, and every general attempt to weaken this
stimulus, however benevolent its apparent intention, will always defeat its own
purpose. If men are induced to marry from a prospect of parish provision, with little
or no chance of maintaining their families in independence, they are not only
unjustly tempted to bring unhappiness and dependence upon themselves and
children, but they are tempted, without knowing it, to injure all in the same class
with themselves. A labourer who marries without being able to support a family
may in some respects be considered as an enemy to all his fellow-labourers.

I feel no doubt whatever that the parish laws of England have contributed to
raise the price of provisions and to lower the real price of labour. They have
therefore contributed to impoverish that class of people whose only possession is their labour. It is also difficult to suppose that they have not powerfully contributed to generate that carelessness and want of frugality observable among the poor, so contrary to the disposition frequently to be remarked among petty tradesmen and small farmers. The labouring poor, to use a vulgar expression, seem always to live from hand to mouth. Their present wants employ their whole attention, and they seldom think of the future. Even when they have an opportunity of saving they seldom exercise it, but all that is beyond their present necessities goes, generally speaking, to the ale-house. The poor laws of England may therefore be said to diminish both the power and the will to save among the common people, and thus to weaken one of the strongest incentives to sobriety and industry, and consequently to happiness.

It is a general complaint among master manufacturers that high wages ruin all their workmen, but it is difficult to conceive that these men would not save a part of their high wages for the future support of their families, instead of spending it in drunkenness and dissipation, if they did not rely on parish assistance for support in case of accidents. And that the poor employed in manufactures consider this assistance as a reason why they may spend all the wages they earn and enjoy themselves while they can appears to be evident from the number of families that, upon the failure of any great manufactory, immediately fall upon the parish, when perhaps the wages earned in this manufactory while it flourished were sufficiently above the price of common country labour to have allowed them to save enough for their support till they could find some other channel for their industry.

A man who might not be deterred from going to the ale-house from the consideration that on his death, or sickness, he should leave his wife and family upon the parish might yet hesitate in thus dissipating his earnings if he were assured that, in either of these cases, his family must starve or be left to the support of casual bounty. In China, where the real as well as nominal price of labour is very low, sons are yet obliged by law to support their aged and helpless parents. Whether such a law would be advisable in this country I will not pretend to determine. But it seems at any rate highly improper, by positive institutions, which render dependent poverty so general, to weaken that disgrace, which for the best and most humane reasons ought to attach to it.

The mass of happiness among the common people cannot but be diminished when one of the strongest checks to idleness and dissipation is thus removed, and when men are thus allured to marry with little or no prospect of being able to maintain a family in independence. Every obstacle in the way of marriage must undoubtedly be considered as a species of unhappiness. But as from the laws of our nature some check to population must exist, it is better that it should be checked from a foresight of the difficulties attending a family and the fear of dependent poverty than that it should be encouraged, only to be repressed afterwards by want and sickness.

It should be remembered always that there is an essential difference between food and those wrought commodities, the raw materials of which are in great plenty. A demand for these last will not fail to create them in as great a quantity as they are wanted. The demand for food has by no means the same creative power. In a country where all the fertile spots have been seized, high offers are necessary to encourage the farmer to lay his dressing on land from which he cannot expect a
profitable return for some years. And before the prospect of advantage is sufficiently
great to encourage this sort of agricultural enterprise, and while the new produce is
rising, great distresses may be suffered from the want of it. The demand for an
increased quantity of subsistence is, with few exceptions, constant everywhere, yet
we see how slowly it is answered in all those countries that have been long occupied.

The poor laws of England were undoubtedly instituted for the most
benevolent purpose, but there is great reason to think that they have not succeeded
in their intention. They certainly mitigate some cases of very severe distress which
might otherwise occur, yet the state of the poor who are supported by parishes,
considered in all its circumstances, is very far from being free from misery. But one
of the principal objections to them is that for this assistance which some of the poor
receive, in itself almost a doubtful blessing, the whole class of the common people of
England is subjected to a set of grating, inconvenient, and tyrannical laws, totally
inconsistent with the genuine spirit of the constitution. The whole business of
settlements, even in its present amended state, is utterly contradictory to all ideas
of freedom. The parish persecution of men whose families are likely to become
chargeable, and of poor women who are near lying-in, is a most disgraceful and
disgusting tyranny. And the obstructions continuity occasioned in the market of
labour by these laws have a constant tendency to add to the difficulties of those who
are struggling to support themselves without assistance.

These evils attendant on the poor laws are in some degree irremediable. If
assistance be to be distributed to a certain class of people, a power must be given
somewhere of discriminating the proper objects and of managing the concerns of the
institutions that are necessary, but any great interference with the affairs of other
people is a species of tyranny, and in the common course of things the exercise of
this power may be expected to become grating to those who are driven to ask for
support. The tyranny of Justices, Church-wardens, and Overseers, is a common
complaint among the poor, but the fault does not lie so much in these persons, who
probably, before they were in power, were not worse than other people, but in the
nature of all such institutions.

The evil is perhaps gone too far to be remedied, but I feel little doubt in my
own mind that if the poor laws had never existed, though there might have been a
few more instances of very severe distress, yet that the aggregate mass of happiness
among the common people would have been much greater than it is at present. . . .

To remove the wants of the lower classes of society is indeed an arduous task.
The truth is that the pressure of distress on this part of a community is an evil so
deeply seated that no human ingenuity can reach it. Were I to propose a palliative,
and palliatives are all that the nature of the case will admit, it should be, in the first
place, the total abolition of all the present parish-laws. This would at any rate give
liberty and freedom of action to the peasantry of England, which they can hardly be
said to possess at present. They would then be able to settle without interruption,
wherever there was a prospect of a greater plenty of work and a higher price for
labour. The market of labour would then be free, and those obstacles removed
which, as things are now, often for a considerable time prevent the price from rising
according to the demand.

Secondly, premiums might be given for turning up fresh land, and it possible
couragements held out to agriculture above manufactures, and to tillage above
grazing. Every endeavour should be used to weaken and destroy all those
institutions relating to corporations, apprenticeships, etc., which cause the labours of agriculture to be worse paid than the labours of trade and manufactures. For a country can never produce its proper quantity of food while these distinctions remain in favour of artisans. Such encouragements to agriculture would tend to furnish the market with an increasing quantity of healthy work, and at the same time, by augmenting the produce of the country, would raise the comparative price of labour and ameliorate the condition of the labourer. Being now in better circumstances, and seeing no prospect of parish assistance, he would be more able, as well as more inclined, to enter into associations for providing against the sickness of himself or family.

Lastly, for cases of extreme distress, county workhouses might be established, supported by rates upon the whole kingdom, and free for persons of all counties, and indeed of all nations. The fare should be hard, and those that were able obliged to work. It would be desirable that they should not be considered as comfortable asylums in all difficulties, but merely as places where severe distress might find some alleviation. A part of these houses might be separated, or others built for a most beneficial purpose, which has not been infrequently taken notice of, that of providing a place where any person, whether native or foreigner, might do a day's work at all times and receive the market price for it. Many cases would undoubtedly be left for the exertion of individual benevolence.

A plan of this kind, the preliminary of which should be an abolition of all the present parish laws, seems to be the best calculated to increase the mass of happiness among the common people of England. To prevent the recurrence of misery, is, alas! beyond the power of man. In the vain endeavour to attain what in the nature of things is impossible, we now sacrifice not only possible but certain benefits. We tell the common people that if they will submit to a code of tyrannical regulations, they shall never be in want. They do submit to these regulations. They perform their part of the contract, but we do not, nay cannot, perform ours, and thus the poor sacrifice the valuable blessing of liberty and receive nothing that can be called an equivalent in return.

Notwithstanding, then, the institution of the poor laws in England, I think it will be allowed that considering the state of the lower classes altogether, both in the towns and in the country, the distresses which they suffer from the want of proper and sufficient food, from hard labour and unwholesome habitations, must operate as a constant check to incipient population.

To these two great checks to population, in all long occupied countries, which I have called the preventive and the positive checks, may be added vicious customs with respect to women, great cities, unwholesome manufactures, luxury, pestilence, and war.

All these checks may be fairly resolved into misery and vice. And that these are the true causes of the slow increase of population in all the states of modern Europe, will appear sufficiently evident from the comparatively rapid increase that has invariably taken place whenever these causes have been in any considerable degree removed.

*from* CHAPTERS 6 and 7
[In considering fresh settlements of Europeans into colonies abroad] we should be led into an error if we were thence to suppose that population and food ever really increases in the same ratio. Where there are few people, and a great quantity of fertile land, the power of the earth to afford a yearly increase of food may be compared to a great reservoir of water, supplied by a moderate stream. The faster population increases, the more help we be got to draw off the water, and consequently an increasing quantity will be taken every year. But the sooner, undoubtedly with the reservoir be exhausted, and the streams only remain. When acre has been added to acre, till all the fertile land is occupied, the yearly increase of food will depend upon the amelioration of the land already in possession; and even this moderate stream will be gradually diminishing. These facts seem to show that population increases exactly in the proportion that the two great checks to it, misery and vice, are removed, and that there is not a truer criterion of the happiness and innocence of a people than the rapidity of their increase. The unwholesomeness of towns, to which some persons are necessarily driven from the nature of their trades, must be considered as a species of misery, and every the slightest check to marriage, from a prospect of the difficulty of maintaining a family, may be fairly classed under the same head. In short it is difficult to conceive any check to population which does not come under the description of some species of misery or vice. It accords with the most liberal spirit of philosophy to suppose that not a stone can fall, or a plant rise, without the immediate agency of divine power. But we know from experience that these operations of what we call nature have been conducted almost invariably according to fixed laws. And since the world began, the causes of population and depopulation have probably been as constant as any of the laws of nature with which we are acquainted.

The passion between the sexes has appeared in every age to be so nearly the same that it may always be considered, in algebraic language, as a given quantity. The great law of necessity which prevents population from increasing in any country beyond the food which it can either produce or acquire, is a law so open to our view, so obvious and evident to our understandings, and so completely confirmed by the experience of every age, that we cannot for a moment doubt it. The different modes which nature takes to prevent or repress a redundant population do not appear, indeed, to us so certain and regular, but though we cannot always predict the mode we may with certainty predict the fact. If the proportion of births to deaths for a few years indicate an increase of numbers much beyond the proportional increased or acquired produce of the country, we may be perfectly certain that unless an emigration takes place, the deaths will shortly exceed the births; and that the increase that had taken place for a few years cannot be the real average increase of the population of the country. Were there no other depopulating causes, every country would, without doubt, be subject to periodical pestilences or famine.

CHAPTER 8
Mr Wallace - Error of supposing that the difficulty arising from population is at a great distance - Mr Condorcet's sketch of the progress of the human mind- Period when the oscillation, mentioned by Mr Condorcet, ought to be applied to the human race.
To a person who draws the preceding obvious inferences, from a view of the past and present state of mankind, it cannot but be a matter of astonishment that all the writers on the perfectibility of man and of society who have noticed the argument of an overcharged population, treat it always very slightly and invariably represent the difficulties arising from it as at a great and almost immeasurable distance. Even Mr Wallace, who thought the argument itself of so much weight as to destroy his whole system of equality, did not seem to be aware that any difficulty would occur from this cause till the whole earth had been cultivated like a garden and was incapable of any further increase of produce. Were this really the case, and were a beautiful system of equality in other respects practicable, I cannot think that our ardour in the pursuit of such a scheme ought to be damped by the contemplation of so remote a difficulty. An event at such a distance might fairly be left to providence, but the truth is that if the view of the argument given in this Essay be just the difficulty, so far from being remote, would be imminent and immediate. At every period during the progress of cultivation, from the present moment to the time when the whole earth was become like a garden, the distress for want of food would be constantly pressing on all mankind, if they were equal. Though the produce of the earth might be increasing every year, population would be increasing much faster, and the redundancy must necessarily be repressed by the periodical or constant action of misery or vice.

Mr Condorcet's *Esquisse d'un Tableau Historique des Progres de l'Esprit Humain*, was written, it is said, under the pressure of that cruel proscription which terminated in his death. If he had no hopes of its being seen during his life and of its interesting France in his favour, it is a singular instance of the attachment of a man to principles, which every day's experience was so fatally for himself contradicting. To see the human mind in one of the most enlightened nations of the world, and after a lapse of some thousand years, debased by such a fermentation of disgusting passions, of fear, cruelty, malice, revenge, ambition, madness, and folly as would have disgraced the most savage nation in the most barbarous age must have been such a tremendous shock to his ideas of the necessary and inevitable progress of the human mind that nothing but the firmest conviction of the truth of his principles, in spite of all appearances, could have withstood.

This posthumous publication is only a sketch of a much larger work, which he proposed should be executed. It necessarily, therefore, wants that detail and application which can alone prove the truth of any theory. A few observations will be sufficient to show how completely the theory is contradicted when it is applied to the real, and not to an imaginary, state of things.

In the last division of the work, which treats of the future progress of man towards perfection, he says, that comparing, in the different civilized nations of Europe, the actual population with the extent of territory, and observing their cultivation, their industry, their divisions of labour, and their means of subsistence, we shall see that it would be impossible to preserve the same means of subsistence, and, consequently, the same population, without a number of individuals who have no other means of supplying their wants than their industry. Having allowed the necessity of such a class of men, and adverting afterwards to the precarious revenue of those families that would depend so entirely on the life and health of their chief, he says, very justly: 'There exists then, a necessary cause of inequality, of dependence, and even of misery, which menaces, without ceasing, the most
numerous and active class of our societies.' (To save time and long quotations, I shall here give the substance of some of Mr Condorcet's sentiments, and hope I shall not misrepresent them. But I refer the reader to the work itself, which will amuse, if it does not convince him.) The difficulty is just and well stated, and I am afraid that the mode by which he proposes it should be removed will be found inefficacious. By the application of calculations to the probabilities of life and the interest of money, he proposes that a fund should be established which should assure to the old an assistance, produced, in part, by their own former savings, and, in part, by the savings of individuals who in making the same sacrifice die before they reap the benefit of it. The same, or a similar fund, should give assistance to women and children who lose their husbands, or fathers, and afford a capital to those who were of an age to found a new family, sufficient for the proper development of their industry. These establishments, he observes, might be made in the name and under the protection of the society. Going still further, he says that, by the just application of calculations, means might be found of more completely preserving a state of equality, by preventing credit from being the exclusive privilege of great fortunes, and yet giving it a basis equally solid, and by rendering the progress of industry, and the activity of commerce, less dependent on great capitalists.

Such establishments and calculations may appear very promising upon paper, but when applied to real life they will be found to be absolutely nugatory. Mr Condorcet allows that a class of people which maintains itself entirely by industry is necessary to every state. Why does he allow this? No other reason can well be assigned than that he conceives that the labour necessary to procure subsistence for an extended population will not be performed without the goad of necessity. If by establishments of this kind of spur to industry be removed, if the idle and the negligent are placed upon the same footing with regard to their credit, and the future support of their wives and families, as the active and industrious, can we expect to see men exert that animated activity in bettering their condition which now forms the master spring of public prosperity? If an inquisition were to be established to examine the claims of each individual and to determine whether he had or had not exerted himself to the utmost, and to grant or refuse assistance accordingly, this would be little else than a repetition upon a larger scale of the English poor laws and would be completely destructive of the true principles of liberty and equality.

But independent of this great objection to these establishments, and supposing for a moment that they would give no check to productive industry, by far the greatest difficulty remains yet behind.

Were every man sure of a comfortable provision for his family, almost every man would have one, and were the rising generation free from the 'killing frost' of misery, population must rapidly increase. Of this Mr Condorcet seems to be fully aware himself... [But] he then adds: "There is no person who does not see how very distant such a period is from us, but shall we ever arrive at it? It is equally impossible to pronounce for or against the future realization of an event which cannot take place but at an era when the human race will have attained improvements, of which we can at present scarcely form a conception."

Mr Condorcet's picture of what may be expected to happen when the number of men shall surpass the means of their subsistence is justly drawn. The oscillation which he describes will certainly take place and will without doubt be a constantly
subsisting cause of periodical misery. The only point in which I differ from Mr Condorcet with regard to this picture is the period when it may be applied to the human race. Mr Condorcet thinks that it cannot possibly be applicable but at an era extremely distant. If the proportion between the natural increase of population and food which I have given be in any degree near the truth, it will appear, on the contrary, that the period when the number of men surpass their means of subsistence has long since arrived, and that this necessity oscillation, this constantly subsisting cause of periodical misery, has existed ever since we have had any histories of mankind, does exist at present, and will for ever continue to exist, unless some decided change take place in the physical constitution of our nature.

Mr Condorcet, however, goes on to say that should the period, which he conceives to be so distant, ever arrive, the human race, and the advocates for the perfectibility of man, need not be alarmed at it. He then proceeds to remove the difficulty in a manner which I profess not to understand. Having observed, that the ridiculous prejudices of superstition would by that time have ceased to throw over morals a corrupt and degrading austerity, he alludes, either to a promiscuous concubinage, which would prevent breeding, or to something else as unnatural. To remove the difficulty in this way will, surely, in the opinion of most men, be to destroy that virtue and purity of manners, which the advocates of equality, and of the perfectibility of man, profess to be the end and object of their views.

CHAPTER 9

Mr Condorcet's conjecture concerning the organic perfectibility of man, and the indefinite prolongation of human life - Fallacy of the argument, which infers an unlimited progress from a partial improvement, the limit of which cannot be ascertained, illustrated in the breeding of animals, and the cultivation of plants.

THE last question which Mr Condorcet proposes for examination is the organic perfectibility of man. He observes that if the proofs which have been already given and which, in their development will receive greater force in the work itself, are sufficient to establish the indefinite perfectibility of man upon the supposition of the same natural faculties and the same organization which he has at present, what will be the certainty, what the extent of our hope, if this organization, these natural faculties themselves, are susceptible of amelioration?

From the improvement of medicine, from the use of more wholesome food and habitations, from a manner of living which will improve the strength of the body by exercise without impairing it by excess, from the destruction of the two great causes of the degradation of man, misery, and too great riches, from the gradual removal of transmissible and contagious disorders by the improvement of physical knowledge, rendered more efficacious by the progress of reason and of social order, he infers that though man will not absolutely become immortal, yet that the duration between his birth and natural death will increase without ceasing, will have no assignable term, and may properly be expressed by the word 'indefinite'. He then defines this word to mean either a constant approach to an unlimited extent, without ever reaching it, or an increase. In the immensity of ages to an extent greater than any assignable quantity.

But surely the application of this term in either of these senses to the duration of human life is in the highest degree unphilosophical and totally
unwarranted by any appearances in the laws of nature. Variations from different causes are essentially distinct from a regular and unretrograde increase. The average duration of human life will to a certain degree vary from healthy or unhealthy climates, from wholesome or unwholesome food, from virtuous or vicious manners, and other causes, but it may be fairly doubted whether there is really the smallest perceptible advance in the natural duration of human life since first we have had any authentic history of man. The prejudices of all ages have indeed been directly contrary to this supposition, and though I would not lay much stress upon these prejudices, they will in some measure tend to prove that there has been no marked advance in an opposite direction.

It may perhaps be said that the world is yet so young, so completely in its infancy, that it ought not to be expected that any difference should appear so soon. If this be the case, there is at once an end of all human science. The whole train of reasonings from effects to causes will be destroyed. We may shut our eyes to the book of nature, as it will no longer be of any use to read it. The wildest and most improbable conjectures may be advanced with as much certainty as the most just and sublime theories, founded on careful and reiterated experiments. We may return again to the old mode of philosophising and make facts bend to systems, instead of establishing systems upon facts. The grand and consistent theory of Newton will be placed upon the same footing as the wild and eccentric hypotheses of Descartes. In short, if the laws of nature are thus fickle and inconstant, if it can be affirmed and be believed that they will change, when for ages and ages they have appeared immutable, the human mind will no longer have any incitements to inquiry, but must remain fixed in inactive torpor, or amuse itself only in bewildering dreams and extravagant fancies.

The constancy of the laws of nature and of effects and causes is the foundation of all human knowledge, though far be it from me to say that the same power which framed and executes the laws of nature may not change them all in a moment, in the twinkling of an eye. Such a change may undoubtedly happen. All that I mean to say is that it is impossible to infer it from reasoning. If without any previous observable symptoms or indications of a change, we can infer that a change will take place, we may as well make any assertion whatever and think it as unreasonable to be contradicted in affirming that the moon will come in contact with the earth tomorrow, as in saying that the sun will rise at its usual time.

With regard to the duration of human life, there does not appear to have existed from the earliest ages of the world to the present moment the smallest permanent symptom or indication of increasing prolongation. The observable effects of climate, habit, diet, and other causes, on length of life have furnished the pretext for asserting its indefinite extension; and the sandy foundation on which the argument rests is that because the limit of human life is undefined; because you cannot mark its precise term, and say so far exactly shall it go and no further; that therefore its extent may increase for ever, and be properly termed indefinite or unlimited. But the fallacy and absurdity of this argument will sufficiently appear from a slight examination of what Mr Condorcet calls the organic perfectibility, or degeneration, of the race of plants and animals, which he says may be regarded as one of the general laws of nature.

I am told that it is a maxim among the improvers of cattle that you may breed to any degree of nicety you please, and they found this maxim upon another,
which is that some of the offspring will possess the desirable qualities of the parents in a greater degree. In the famous Leicestershire breed of sheep, the object is to procure them with small heads and small legs. Proceeding upon these breeding maxims, it is evident that we might go on till the heads and legs were evanescent quantities, but this is so palpable an absurdity that we may be quite sure that the premises are not just and that there really is a limit, though we cannot see it or say exactly where it is. In this case, the point of the greatest degree of improvement, or the smallest size of the head and legs, may be said to be undefined, but this is very different from unlimited, or from indefinite, in Mr Condorcet's acceptance of the term. Though I may not be able in the present instance to mark the limit at which further improvement will stop, I can very easily mention a point at which it will not arrive. I should not scruple to assert that were the breeding to continue for ever, the head and legs of these sheep would never be so small as the head and legs of a rat.

It cannot be true, therefore, that among animals, some of the offspring will possess the desirable qualities of the parents in a greater degree, or that animals are indefinitely perfectible.

The progress of a wild plant to a beautiful garden flower is perhaps more marked and striking than anything that takes place among animals, yet even here it would be the height of absurdity to assert that the progress was unlimited or indefinite.

One of the most obvious features of the improvement is the increase of size. The flower has grown gradually larger by cultivation. If the progress were really unlimited it might be increased ad infinitum, but this is so gross an absurdity that we may be quite sure that among plants as well as among animals there is a limit to improvement, though we do not exactly know where it is. It is probable that the gardeners who contend for flower prizes have often applied stronger dressing without success. At the same time it would be highly presumptuous in any man to say that he had seen the finest carnation or anemone that could ever be made to grow. He might however assert without the smallest chance of being contradicted by a future fact, that no carnation or anemone could ever by cultivation be increased to the size of a large cabbage; and yet there are assignable quantities much greater than a cabbage. No man can say that he has seen the largest ear of wheat, or the largest oak that could ever grow; but he might easily, and with perfect certainty, name a point of magnitude at which they would not arrive. In all these cases therefore, a careful distinction should be made, between an unlimited progress, and a progress where the limit is merely undefined.

It will be said, perhaps, that the reason why plants and animals cannot increase indefinitely in size is, that they would fall by their own weight. I answer, how do we know this but from experience? -- from experience of the degree of strength with which these bodies are formed. I know that a carnation, long before it reached the size of a cabbage, would not be supported by its stalk, but I only know this from my experience of the weakness and want of tenacity in the materials of a carnation stalk. There are many substances in nature of the same size that would support as large a head as a cabbage.

The reasons of the mortality of plants are at present perfectly unknown to us. No man can say why such a plant is annual, another biennial, and another endures for ages. The whole affair in all these cases, in plants, animals, and in the human
race, is an affair of experience, and I only conclude that man is mortal because the
invariable experience of all ages has proved the mortality of those materials of which
his visible body is made: "What can we reason, but from what we know?"

Sound philosophy will not authorize me to alter this opinion of the mortality
of man on earth, till it can be clearly proved that the human race has made, and is
making, a decided progress towards an illimitable extent of life. And the chief reason
why I adduced the two particular instances from animals and plants was to expose
and illustrate, if I could, the fallacy of that argument which infers an unlimited
progress, merely because some partial improvement has taken place, and that the
limit of this improvement cannot be precisely ascertained.

The capacity of improvement in plants and animals, to a certain degree, no
person can possibly doubt. A clear and decided progress has already been made, and
yet, I think, it appears that it would be highly absurd to say that this progress has
no limits. In human life, though there are great variations from different causes, it
may be doubted whether, since the world began, any organic improvement whatever
in the human frame can be clearly ascertained. The foundations, therefore, on which
the arguments for the organic perfectibility of man rest, are unusually weak, and
can only be considered as mere conjectures. It does not, however, by any means
seem impossible that by an attention to breed, a certain degree of improvement,
similar to that among animals, might take place among men. Whether intellect
could be communicated may be a matter of doubt: but size, strength, beauty,
complexion, and perhaps even longevity are in a degree transmissible. The error
does not seem to lie in supposing a small degree of improvement possible, but in not
discriminating between a small improvement, the limit of which is undefined, and an
improvement really unlimited. As the human race, however, could not be improved
in this way, without condemning all the bad specimens to celibacy, it is not probable
that an attention to breed should ever become general; indeed, I know of no
well-directed attempts of this kind, except in the ancient family of the Bickerstaffs,
who are said to have been very successful in whitening the skins and increasing the
height of their race by prudent marriages, particularly by that very judicious cross
with Maud, the milk-maid, by which some capital defects in the constitutions of the
family were corrected.

It will not be necessary, I think, in order more completely to show the
improbability of any approach in man towards immortality on earth, to urge the
very great additional weight that an increase in the duration of life would give to
the argument of population.

Many, I doubt not, will think that the attempting gravely to controvert so
absurd a paradox as the immortality of man on earth, or indeed, even the
perfectibility of man and society, is a waste of time and words, and that such
unfounded conjectures are best answered by neglect. I profess, however, to be of a
different opinion. When paradoxes of this kind are advanced by ingenious and able
men, neglect has no tendency to convince them of their mistakes. Priding
themselves on what they conceive to be a mark of the reach and size of their own
understandings, of the extent and comprehensiveness of their views, they will look
upon this neglect merely as an indication of poverty, and narrowness, in the mental
exertions of their contemporaries, and only think that the world is not yet prepared
to receive their sublime truths.
On the contrary, a candid investigation of these subjects, accompanied with a perfect readiness to adopt any theory warranted by sound philosophy, may have a tendency to convince them that in forming improbable and unfounded hypotheses, so far from enlarging the bounds of human science, they are contracting it, so far from promoting the improvement of the human mind, they are obstructing it; they are throwing us back again almost into the infancy of knowledge and weakening the foundations of that mode of philosophising, under the auspices of which science has of late made such rapid advances. The present rage for wide and unrestrained speculation seems to be a kind of mental intoxication, arising, perhaps, from the great and unexpected discoveries which have been made of late years, in various branches of science. To men elate and giddy with such successes, everything appeared to be within the grasp of human powers; and, under this illusion, they confounded subjects where no real progress could be proved with those where the progress had been marked, certain, and acknowledged. Could they be persuaded to sober themselves with a little severe and chastised thinking, they would see, that the cause of truth, and of sound philosophy, cannot but suffer by substituting wild flights and unsupported assertions for patient investigation, and well authenticated proofs.

Mr Condorcet’s book may be considered not only as a sketch of the opinions of a celebrated individual, but of many of the literary men in France at the beginning of the Revolution. As such, though merely a sketch, it seems worthy of attention.

CHAPTER 10

Mr Godwin’s system of equality - Error of attributing all the vices of mankind to human institutions - Mr Godwin’s first answer to the difficulty arising from population totally insufficient - Mr Godwin’s beautiful system of equality supposed to be realized - In utter destruction simply from the principle of population in so short a time as thirty years.

IN reading Mr Godwin’s ingenious and able work on Political Justice, it is impossible not to be struck with the spirit and energy of his style, the force and precision of some of his reasonings, the ardent tone of his thoughts, and particularly with that impressive earnestness of manner which gives an air of truth to the whole. At the same time, it must be confessed that he has not proceeded in his inquiries with the caution that sound philosophy seems to require. His conclusions are often unwarranted by his premises. He fails sometimes in removing the objections which he himself brings forward. He relies too much on general and abstract propositions which will not admit of application. And his conjectures certainly far outstrip the modesty of nature.

The system of equality which Mr Godwin proposes is, without doubt, by far the most beautiful and engaging of any that has yet appeared. An amelioration of society to be produced merely by reason and conviction wears much more the promise of permanence than any change effected and maintained by force. The unlimited exercise of private judgement is a doctrine inexpressibly grand and captivating and has a vast superiority over those systems where every individual is in a manner the slave of the public. The substitution of benevolence as the master-spring and moving principle of society, instead of self-love, is a
consummation devoutly to be wished. In short, it is impossible to contemplate the 
whole of this fair structure without emotions of delight and admiration, 
accompanied with ardent longing for the period of its accomplishment. But, alas! 
that moment can never arrive. The whole is little better than a dream, a beautiful 
phantom of the imagination. These ‘gorgeous palaces’ of happiness and immortality, 
these ‘solemn temples’ of truth and virtue will dissolve, ‘like the baseless fabric of a 
vision’, when we awaken to real life and contemplate the true and genuine situation 
of man on earth. Mr Godwin, at the conclusion of the third CHAPTER of his eighth 
book, speaking of population, says:

There is a principle in human society, by which population is perpetually kept 
down to the level of the means of subsistence. Thus among the wandering tribes of 
America and Asia, we never find through the lapse of ages that population has so 
increased as to render necessary the cultivation of the earth.

This principle, which Mr Godwin thus mentions as some mysterious and occult 
cause and which he does not attempt to investigate, will be found to be the grinding 
law of necessity, misery, and the fear of misery. The great error under which Mr Godwin labours throughout his whole work is the 
attributing almost all the vices and misery that are seen in civil society to human 
institutions. Political regulations and the established administration of property are 
with him the fruitful sources of all evil, the hotbeds of all the crimes that degrade 
mankind. Were this really a true state of the case, it would not seem a hopeless task 
to remove evil completely from the world, and reason seems to be the proper and 
adequate instrument for effecting so great a purpose. But the truth is, that though 
human institutions appear to be the obvious and obtrusive causes of much mischief 
to mankind, yet in reality they are light and superficial, they are mere feathers that 
float on the surface, in comparison with those deeper seated causes of impurity that 
corrupt the springs and render turbid the whole stream of human life.

Mr Godwin, in his chapter on the benefits attendant on a system of equality, 
says:

The spirit of oppression, the spirit of servility, and the spirit of fraud, 
these are the immediate growth of the established administration of 
property. They are alike hostile to intellectual improvement. The other vices 
of envy, malice, and revenge are their inseparable companions. In a state 
of society where men lived in the midst of plenty and where all shared alike 
the bounties of nature, these sentiments would inevitably expire. The 
narrow principle of selfishness would vanish. No man being obliged to 
guard his little store or provide with anxiety and pain for his restless wants, 
each would lose his individual existence in the thought of the general good. 
No man would be an enemy to his neighbour, for they would have no 
subject of contention, and, of consequence, philanthropy would resume the 
empire which reason assigns her. Mind would be delivered from her 
perpetual anxiety about corporal support, and free to expatiate in the field 
of thought, which is congenial to her. Each would assist the inquiries of all.
This would, indeed, be a happy state. But that it is merely an imaginary picture, with scarcely a feature near the truth, the reader, I am afraid, is already too well convinced.

Man cannot live in the midst of plenty. All cannot share alike the bounties of nature. Were there no established administration of property, every man would be obliged to guard with force his little store. Selfishness would be triumphant. The subjects of contention would be perpetual. Every individual mind would be under a constant anxiety about corporal support, and not a single intellect would be left free to expatiate in the field of thought.

How little Mr Godwin has turned the attention of his penetrating mind to the real state of man on earth will sufficiently appear from the manner in which he endeavours to remove the difficulty of an overcharged population. He says: “The obvious answer to this objection, is, that to reason thus is to foresee difficulties at a great distance. Three fourths of the habitable globe is now uncultivated. The parts already cultivated are capable of immeasurable improvement. Myriads of centuries of still increasing population may pass away, and the earth be still found sufficient for the subsistence of its inhabitants.”

I have already pointed out the error of supposing that no distress and difficulty would arise from an overcharged population before the earth absolutely refused to produce any more. But let us imagine for a moment Mr Godwin’s beautiful system of equality realized in its utmost purity, and see how soon this difficulty might be expected to press under so perfect a form of society. A theory that will not admit of application cannot possibly be just.

Let us suppose all the causes of misery and vice in this island removed. War and contention cease. Unwholesome trades and manufactories do not exist. Crowds no longer collect together in great and pestilent cities for purposes of court intrigue, of commerce, and vicious gratifications. Simple, healthy, and rational amusements take place of drinking, gaming, and debauchery. There are no towns sufficiently large to have any prejudicial effects on the human constitution. The greater part of the happy inhabitants of this terrestrial paradise live in hamlets and farmhouses scattered over the face of the country. Every house is clean, airy, sufficiently roomy, and in a healthy situation. All men are equal. The labours of luxury are at end. And the necessary labours of agriculture are shared amicably among all. The number of persons, and the produce of the island, we suppose to be the same as at present. The spirit of benevolence, guided by impartial justice, will divide this produce among all the members of the society according to their wants. Though it would be impossible that they should all have animal food every day, yet vegetable food, with meat occasionally, would satisfy the desires of a frugal people and would be sufficient to preserve them in health, strength, and spirits.

Mr Godwin considers marriage as a fraud and a monopoly. Let us suppose the commerce of the sexes established upon principles of the most perfect freedom. Mr Godwin does not think himself that this freedom would lead to a promiscuous intercourse, and in this I perfectly agree with him. The love of variety is a vicious, corrupt, and unnatural taste and could not prevail in any great degree in a simple and virtuous state of society. Each man would probably select himself a partner, to whom he would adhere as long as that adherence continued to be the choice of both parties. It would be of little consequence, according to Mr Godwin, how many children a woman had or to whom they belonged. Provisions and assistance would
spontaneously flow from the quarter in which they abounded, to the quarter that was deficient. And every man would be ready to furnish instruction to the rising generation according to his capacity.

I cannot conceive a form of society so favourable upon the whole to population. The irremediableness of marriage, as it is at present constituted, undoubtedly deters many from entering into that state. An unshackled intercourse on the contrary would be a most powerful incitement to early attachments, and as we are supposing no anxiety about the future support of children to exist, I do not conceive that there would be one woman in a hundred, of twenty-three, without a family.

With these extraordinary encouragements to population, and every cause of depopulation, as we have supposed, removed, the numbers would necessarily increase faster than in any society that has ever yet been known. . . . Alas! what becomes of the picture where men lived in the midst of plenty, where no man was obliged to provide with anxiety and pain for his restless wants, where the narrow principle of selfishness did not exist, where Mind was delivered from her perpetual anxiety about corporal support and free to expatiate in the field of thought which is congenial to her. This beautiful fabric of imagination vanishes at the severe touch of truth. The spirit of benevolence, cherished and invigorated by plenty, is repressed by the chilling breath of want. The hateful passions that had vanished reappear. The mighty law of self-preservation expels all the softer and more exalted emotions of the soul. The temptations to evil are too strong for human nature to resist. The corn is plucked before it is ripe, or secreted in unfair proportions, and the whole black train of vices that belong to falsehood are immediately generated. Provisions no longer flow in for the support of the mother with a large family. The children are sickly from insufficient food. The rosy flush of health gives place to the pallid cheek and hollow eye of misery. Benevolence, yet lingering in a few bosoms, makes some faint expiring struggles, till at length self-love resumes his wonted empire and lords it triumphant over the world. . . .

It is a perfectly just observation of Mr Godwin, that, ‘There is a principle in human society, by which population is perpetually kept down to the level of the means of subsistence.’ The sole question is, what is this principle? is it some obscure and occult cause? Is it some mysterious interference of heaven which, at a certain period, strikes the men with impotence, and the women with barrenness? Or is it a cause, open to our researches, within our view, a cause, which has constantly been observed to operate, though with varied force, in every state in which man has been placed? Is it not a degree of misery, the necessary and inevitable result of the laws of nature, which human institutions, so far from aggravating, have tended considerably to mitigate, though they never can remove?

It may be curious to observe, in the case that we have been supposing, how some of the laws which at present govern civilized society, would be successively dictated by the most imperious necessity. As man, according to Mr Godwin, is the creature of the impressions to which he is subject, the goadings of want could not continue long, before some violations of public or private stock would necessarily take place. As these violations increased in number and extent, the more active and comprehensive intellects of the society would soon perceive, that while population was fast increasing, the yearly produce of the country would shortly begin to diminish. The urgency of the case would suggest the necessity of some mediate
measures to be taken for the general safety. Some kind of convention would then be called, and the dangerous situation of the country stated in the strongest terms. It would be observed, that while they lived in the midst of plenty, it was of little consequence who laboured the least, or who possessed the least, as every man was perfectly willing and ready to supply the wants of his neighbour. But that the question was no longer whether one man should give to another that which he did not use himself, but whether he should give to his neighbour the food which was absolutely necessary to his own existence. It would be represented, that the number of those that were in want very greatly exceeded the number and means of those who should supply them; that these pressing wants, which from the state of the produce of the country could not all be gratified, had occasioned some flagrant violations of justice; that these violations had already checked the increase of food, and would, if they were not by some means or other prevented, throw the whole community in confusion; that imperious necessity seemed to dictate that a yearly increase of produce should, if possible, be obtained at all events; that in order to effect this first, great, and indispensable purpose, it would be advisable to make a more complete division of land, and to secure every man’s stock against violation by the most powerful sanctions, even by death itself.

It might be urged perhaps by some objectors that, as the fertility of the land increased, and various accidents occurred, the share of some men might be much more than sufficient for their support, and that when the reign of self-love was once established, they would not distribute their surplus produce without some compensation in return. It would be observed, in answer, that this was an inconvenience greatly to be lamented; but that it was an evil which bore no comparison to the black train of distresses that would inevitably be occasioned by the insecurity of property; that the quantity of food which one man could consume was necessarily limited by the narrow capacity of the human stomach; that it was not certainly probable that he should throw away the rest; but that even if he exchanged his surplus food for the labour of others, and made them in some degree dependent on him, this would still be better than that these others should absolutely starve.

It seems highly probable, therefore, that an administration of property, not very different from that which prevails in civilized states at present, would be established, as the best, though inadequate, remedy for the evils which were pressing on the society.

The next subject that would come under discussion, intimately connected with the preceding, is the commerce between the sexes. It would be urged by those who had turned their attention to the true cause of the difficulties under which the community laboured, that while every man felt secure that all his children would be well provided for by general benevolence, the powers of the earth would be absolutely inadequate to produce food for the population which would inevitably ensue; that even if the whole attention and labour of the society were directed to this sole point, and if, by the most perfect security of property, and every other encouragement that could be thought of, the greatest possible increase of produce were yearly obtained; yet still, that the increase of food would by no means keep pace with the much more rapid increase of population; that some check to population therefore was imperiously called for; that the most natural and obvious check seemed to be to make every man provide for his own children; that this would
operate in some respect as a measure and guide in the increase of population, as it might be expected that no man would bring beings into the world, for whom he could not find the means of support; that where this notwithstanding was the case, it seemed necessary, for the example of others, that the disgrace and inconvenience attending such a conduct should fall upon the individual, who had thus inconsiderately plunged himself and innocent children in misery and want.

The institution of marriage, or at least, of some express or implied obligation on every man to support his own children, seems to be the natural result of these reasonings in a community under the difficulties that we have supposed.

The view of these difficulties presents us with a very natural origin of the superior disgrace which attends a breach of chastity in the woman than in the man. It could not be expected that women should have resources sufficient to support their own children. When therefore a woman was connected with a man, who had entered into no compact to maintain her children, and, aware of the inconveniences that he might bring upon himself, had deserted her, these children must necessarily fall for support upon the society, or starve. And to prevent the frequent recurrence of such an inconvenience, as it would be highly unjust to punish so natural a fault by personal restraint or infliction, the men might agree to punish it with disgrace. The offence is besides more obvious and conspicuous in the woman, and less liable to any mistake. The father of a child may not always be known, but the same uncertainty cannot easily exist with regard to the mother. Where the evidence of the offence was most complete, and the inconvenience to the society at the same time the greatest, there it was agreed that the large share of blame should fall. The obligation on every man to maintain his children, the society would enforce, if there were occasion; and the greater degree of inconvenience or labour, to which a family would necessarily subject him, added to some portion of disgrace which every human being must incur who leads another into unhappiness, might be considered as a sufficient punishment for the man.

That a woman should at present be almost driven from society for an offence which men commit nearly with impunity, seems to be undoubtedly a breach of natural justice. But the origin of the custom, as the most obvious and effectual method of preventing the frequent recurrence of a serious inconvenience to a community, appears to be natural, though not perhaps perfectly justifiable. This origin, however, is now lost in the new train of ideas which the custom has since generated. What at first might be dictated by state necessity is now supported by female delicacy, and operates with the greatest force on that part of society where, if the original intention of the custom were preserved, there is the least real occasion for it.

When these two fundamental laws of society, the security of property, and the institution of marriage, were once established, inequality of conditions must necessarily follow. Those who were born after the division of property would come into a world already possessed. If their parents, from having too large a family, could not give them sufficient for their support, what are they to do in a world where everything is appropriated? We have seen the fatal effects that would result to a society, if every man had a valid claim to an equal share of the produce of the earth. The members of a family which was grown too large for the original division of land appropriated to it could not then demand a part of the surplus produce of others, as a debt of justice. It has appeared, that from the inevitable laws of our
nature some human beings must suffer from want. These are the unhappy persons who, in the great lottery of life, have drawn a blank. The number of these claimants would soon exceed the ability of the surplus produce to supply. Moral merit is a very difficult distinguishing criterion, except in extreme cases. The owners of surplus produce would in general seek some more obvious mark of distinction. And it seems both natural and just that, except upon particular occasions, their choice should fall upon those who were able, and professed themselves willing, to exert their strength in procuring a further surplus produce; and thus at once benefiting the community, and enabling these proprietors to afford assistance to greater numbers. All who were in want of food would be urged by imperious necessity to offer their labour in exchange for this article so absolutely essential to existence. The fund appropriated to the maintenance of labour would be the aggregate quantity of food possessed by the owners of land beyond their own consumption. When the demands upon this fund were great and numerous, it would naturally be divided in very small shares. Labour would be ill paid. Men would offer to work for a bare subsistence, and the rearing of families would be checked by sickness and misery. On the contrary, when this fund was increasing fast, when it was great in proportion to the number of claimants, it would be divided in much larger shares. No man would exchange his labour without receiving an ample quantity of food in return. Labourers would live in ease and comfort, and would consequently be able to rear a numerous and vigorous offspring.

On the state of this fund, the happiness, or the degree of misery, prevailing among the lower classes of people in every known state at present chiefly depends. And on this happiness, or degree of misery, depends the increase, stationariness, or decrease of population.

And thus it appears, that a society constituted according to the most beautiful form that imagination can conceive, with benevolence for its moving principle, instead of self-love, and with every evil disposition in all its members corrected by reason and not force, would, from the inevitable laws of nature, and not from any original depravity of man, in a very short period degenerate into a society constructed upon a plan not essentially different from that which prevails in every known state at present; I mean, a society divided into a class of proprietors, and a class of labourers, and with self-love the main-spring of the great machine. . . .

from CHAPTERS 11 through 17

WE have supported Mr Godwin's system of society once completely established. But it is supposing an impossibility. The same causes in nature which would destroy it so rapidly, were it once established, would prevent the possibility of its establishment. And upon what grounds we can presume a change in these natural causes, I am utterly at a loss to conjecture. No move towards the extinction of the passion between the sexes has taken place in the five or six thousand years that the world has existed. Men in the decline of life have in all ages declaimed against a passion which they have ceased to feel, but with as little reason as success. Those who from coldness of constitutional temperament have never felt what love is, will surely be allowed to be very incompetent judges with regard to the power of this passion to contribute to the sum of pleasurable sensations in life. Those who have spent their youth in criminal excesses and have prepared for themselves, as the
comforts of their age, corporeal debility and mental remorse may well inveigh against such pleasures as vain and futile, and unproductive of lasting satisfaction. But the pleasures of pure love will bear the contemplation of the most improved reason, and the most exalted virtue. Perhaps there is scarcely a man who has once experienced the genuine delight of virtuous love, however great his intellectual pleasure may have been, that does not look back to the period as the sunny spot in his whole life, where his imagination loves to bask, which he recollects and contemplates with the fondest regrets, and which he would most wish to live over again. The superiority of intellectual to sensual pleasures consists rather in their filling up more time, in their having a larger range, and in their being less liable to satiety, than in their being more real and essential.

Mr Godwin says, in order to show the evident inferiority of the pleasures of sense, “Strip the commerce of the sexes of all its attendant circumstances, and it would be generally despised”. He might as well say to a man who admired trees: strip them of their spreading branches and lovely foliage, and what beauty can you see in a bare pole? But it was the tree with the branches and foliage, and not without them, that excited admiration. One feature of an object may be as distinct, and excite as different emotions, from the aggregate as any two things the most remote, as a beautiful woman, and a map of Madagascar. It is the symmetry of person, the vivacity, the voluptuous softness of temper, the affectionate kindness of feelings, the imagination and the wit of a woman that excite the passion of love, and not the mere distinction of her being female. Urged by the passion of love, men have been driven into acts highly prejudicial to the general interests of society, but probably they would have found no difficulty in resisting the temptation, had it appeared in the form of a woman with no other attractions whatever but her sex. To strip sensual pleasures of all their adjuncts, in order to prove their inferiority, is to deprive a magnet of some of its most essential causes of attraction, and then to say that it is weak and inefficient.

In the pursuit of every enjoyment, whether sensual or intellectual, reason, that faculty which enables us to calculate consequences, is the proper corrective and guide. It is probable therefore that improved reason will always tend to prevent the abuse of sensual pleasures, though it by no means follows that it will extinguish them. But allowing, as I should be inclined to do, notwithstanding numerous instances to the contrary, that great intellectual exertions tend to diminish the empire of this passion over man, it is evident that the mass of mankind must be improved more highly than the brightest ornaments of the species at present before any difference can take place sufficient sensibly to affect population. I would by no means suppose that the mass of mankind has reached its term of improvement, but the principal argument of this essay tends to place in a strong point of view the improbability that the lower classes of people in any country should ever be sufficiently free from want and labour to obtain any high degree of intellectual improvement.

I cannot quit this subject without taking notice of these conjectures of Mr Godwin and Mr Condorcel concerning the indefinite prolongation of human life, as a very curious instance of the longing of the soul after immortality. Both these gentlemen have rejected the light of revelation which absolutely promises eternal life in another state. They have also rejected the light of natural religion, which to the ablest intellects in all ages has indicated the future existence of the soul. Yet so
congenial is the idea of immortality to the mind of man that they cannot consent entirely to throw it out of their systems. After all their fastidious scepticisms concerning the only probable mode of immortality, they introduce a species of immortality of their own, not only completely contradictory to every law of philosophical probability, but in itself in the highest degree narrow, partial, and unjust. They suppose that all the great, virtuous, and exalted minds that have ever existed or that may exist for some thousands, perhaps millions of years, will be sunk in annihilation, and that only a few beings, not greater in number than can exist at once upon the earth, will be ultimately crowned with immortality. Had such a tenet been advanced as a tenet of revelation I am very sure that all the enemies of religion, and probably Mr Godwin and Mr Condorcet among the rest, would have exhausted the whole force of their ridicule upon it, as the most puerile, the most absurd, the poorest, the most pitiful, the most iniquitously unjust, and, consequently, the most unworthy of the Deity that the superstitious folly of man could invent.

What a strange and curious proof do these conjectures exhibit of the inconsistency of scepticism! For it should be observed, that there is a very striking and essential difference between believing an assertion which absolutely contradicts the most uniform experience, and an assertion which contradicts nothing, but is merely beyond the power of our present observation and knowledge. So diversified are the natural objects around us, so many instances of mighty power daily offer themselves to our view, that we may fairly presume, that there are many forms and operations of nature which we have not yet observed, or which, perhaps, we are not capable of observing with our present confined inlets of knowledge. The resurrection of a spiritual body from a natural body does not appear in itself a more wonderful instance of power than the germination of a blade of wheat from the grain, or of an oak from an acorn. Could we conceive an intelligent being, so placed as to be conversant only with inanimate or full grown objects, and never to have witnessed the process of vegetation and growth; and were another being to show him two little pieces of matter, a grain of wheat, and an acorn, to desire him to examine them, to analyse them if he pleased, and endeavour to find out their properties and essences; and then to tell him, that however trifling these little bits of matter might appear to him, that they possessed such curious powers of selection, combination, arrangement, and almost of creation, that upon being put into the ground, they would choose, amongst all the dirt and moisture that surrounded them, those parts which best suited their purpose, that they would collect and arrange these parts with wonderful taste, judgement, and execution, and would rise up into beautiful forms, scarcely in any respect analogous to the little bits of matter which were first placed in the earth. I feel very little doubt that the imaginary being which I have supposed would hesitate more, would require better authority, and stronger proofs, before he believed these strange assertions, than if he had been told, that a being of mighty power, who had been the cause of all that he saw around him, and of that existence of which he himself was conscious, would, by a great act of power upon the death and corruption of human creatures, raise up the essence of thought in an incorporeal, or at least invisible form, to give it a happier existence in another state.

The only difference, with regard to our own apprehensions, that is not in favour of the latter assertion is that the first miracle we have repeatedly seen, and the last miracle we have not seen. The powers of selection, combination, and
transmutation, which every seed shows, are truly miraculous. Who can imagine that these wonderful faculties are contained in these little bits of matter? To me it appears much more philosophical to suppose that the mighty God of nature is present in full energy in all these operations. To this all powerful Being, it would be equally easy to raise an oak without an acorn as with one. The preparatory process of putting seeds into the ground is merely ordained for the use of man, as one among the various other excitements necessary to awaken matter into mind. It is an idea that will be found consistent, equally with the natural phenomena around us, with the various events of human life, and with the successive revelations of God to man, to suppose that the world is a mighty process for the creation and formation of mind. Many vessels will necessarily come out of this great furnace in wrong shapes. These will be broken and thrown aside as useless; while those vessels whose forms are full of truth, grace, and loveliness, will be wafted into happier situations, nearer the presence of the mighty maker. . . .

Mr Godwin considers man too much in the light of a being merely intellectual. This error, at least such I conceive it to be, pervades his whole work and mixes itself with all his reasonings. The voluntary actions of men may originate in their opinions, but these opinions will be very differently modified in creatures compounded of a rational faculty and corporal propensities from what they would be in beings wholly intellectual. Mr Godwin, in proving that sound reasoning and truth are capable of being adequately communicated, examines the proposition first practically, and then adds, ‘Such is the appearance which this proposition assumes, when examined in a loose and practical view. In strict consideration it will not admit of debate. Man is a rational being, etc.’ So far from calling this a strict consideration of the subject, I own I should call it the loosest, and most erroneous, way possible, of considering it. It is the calculating the velocity of a falling body in vacuo, and persisting in it, that it would be the same through whatever resisting mediums it might fall. This was not Newton’s mode of philosophizing. Very few general propositions are just in application to a particular subject. The moon is not kept in her orbit round the earth, nor the earth in her orbit round the sun, by a force that varies merely in the inverse ratio of the squares of the distances. To make the general theory just in application to the revolutions of these bodies, it was necessary to calculate accurately the disturbing force of the sun upon the moon, and of the moon upon the earth; and till these disturbing forces were properly estimated, actual observations on the motions of these bodies would have proved that the theory was not accurately true. . . .

Man, according to Mr Godwin, is a creature formed what he is by the successive impressions which he has received, from the first moment that the germ from which he sprung was animated. Could he be placed in a situation, where he was subject to no evil impressions whatever, though it might be doubted whether in such a situation virtue could exist, vice would certainly be banished. The great bent of Mr Godwin’s work on Political Justice, if I understand it rightly, is to show that the greater part of the vices and weaknesses of men proceed from the injustice of their political and social institutions, and that if these were removed and the understandings of men more enlightened, there would be little or no temptation in the world to evil. As it has been clearly proved, however, (at least as I think) that this is entirely a false conception, and that, independent of any political or social institutions whatever, the greater part of mankind, from the fixed and unalterable
laws of nature, must ever be subject to the evil temptations arising from want, besides other passions, it follows from Mr Godwin's definition of man that such impressions, and combinations of impressions, cannot be afloat in the world without generating a variety of bad men. According to Mr Godwin's own conception of the formation of character, it is surely as improbable that under such circumstances all men will be virtuous as that sixes will come up a hundred times following upon the dice. . . .

The lower classes of people in Europe may at some future period be much better instructed than they are at present; they may be taught to employ the little spare time they have in many better ways than at the ale-house; they may live under better and more equal laws than they have ever hitherto done, perhaps, in any country; and I even conceive it possible, though not probable that they may have more leisure; but it is not in the nature of things that they can be awarded such a quantity of money or subsistence as will allow them all to marry early, in the full confidence that they shall be able to provide with ease for a numerous family. . . .

It has appeared that a society constituted according to Mr Godwin's system must, from the inevitable laws of our nature, degenerate into a class of proprietors and a class of labourers, and that the substitution of benevolence for self-love as the moving principle of society, instead of producing the happy effects that might be expected from so fair a name, would cause the same pressure of want to be felt by the whole of society, which is now felt only by a part. It is to the established administration of property and to the apparently narrow principle of self-love that we are indebted for all the noblest exertions of human genius, all the finer and more delicate emotions of the soul, for everything, indeed, that distinguishes the civilized from the savage state; and no sufficient change has as yet taken place in the nature of civilized man to enable us to say that he either is, or ever will be, in a state when he may safely throw down the ladder by which he has risen to this eminence. . . .

The labour created by luxuries, though useful in distributing the produce of the country, without vitiating the proprietor by power, or debasing the labourer by dependence, has not, indeed, the same beneficial effects on the state of the poor. A great accession of work from manufacturers, though it may raise the price of labour even more than an increasing demand for agricultural labour, yet, as in this case the quantity of food in the country may not be proportionably increasing, the advantage to the poor will be but temporary, as the price of provisions must necessarily rise in proportion to the price of labour. Relative to this subject, I cannot avoid venturing a few remarks on a part of Dr Adam Smith's Wealth of Nations, speaking at the same time with that diffidence which I ought certainly to feel in differing from a person so justly celebrated in the political world. . . .

A question seems naturally to arise here whether the exchangeable value of the annual produce of the land and labour be the proper definition of the wealth of a country, or whether the gross produce of the land, according to the French economists, may not be a more accurate definition. Certain it is that every increase of wealth, according to the definition of the economists, will be an increase of the funds for the maintenance of labour, and consequently will always tend to ameliorate the condition of the labouring poor, though an increase of wealth, according to Dr Adam Smith's definition, will by no means invariably have the same tendency. And yet it may not follow from this consideration that Dr Adam Smith's
definition is not just. It seems in many respects improper to exclude the clothing and lodging of a whole people from any part of their revenue. Much of it may, indeed, be of very trivial and unimportant value in comparison with the food of the country, yet still it may be fairly considered as a part of its revenue; and, therefore, the only point in which I should differ from Dr Adam Smith is where he seems to consider every increase of the revenue or stock of a society as an increase of the funds for the maintenance of labour, and consequently as tending always to ameliorate the condition of the poor.

The fine silks and cottons, the laces, and other ornamental luxuries of a rich country, may contribute very considerably to augment the exchangeable value of its annual produce; yet they contribute but in a very small degree to augment the mass of happiness in the society, and it appears to me that it is with some view to the real utility of the produce that we ought to estimate the productiveness or unproductiveness of different sorts of labour. The French economists consider all labour employed in manufactures as unproductive. Comparing it with the labour employed upon land, I should be perfectly disposed to agree with them, but not exactly for the reasons which they give. They say that labour employed upon land is productive because the produce, over and above completely paying the labourer and the farmer, affords a clear rent to the landlord, and that the labour employed upon a piece of lace is unproductive because it merely replaces the provisions that the workman had consumed, and the stock of his employer, without affording any clear rent whatever. But supposing the value of the wrought lace to be such as that, besides paying in the most complete manner the workman and his employer, it could afford a clear rent to a third person, it appears to me that, in comparison with the labour employed upon land, it would be still as unproductive as ever. Though, according to the reasoning used by the French economists, the man employed in the manufacture of lace would, in this case, seem to be a productive labourer. Yet according to their definition of the wealth of a state, he ought not to be considered in that light. He will have added nothing to the gross produce of the land: he has consumed a portion of this gross produce, and has left a bit of lace in return; and though he may sell this bit of lace for three times the quantity of provisions that he consumed whilst he was making it, and thus be a very productive labourer with regard to himself, yet he cannot be considered as having added by his labour to any essential part of the riches of the state. The clear rent, therefore, that a certain produce can afford, after paying the expenses of procuring it, does not appear to be the sole criterion, by which to judge of the productiveness or unproductiveness to a state of any particular species of labour.

Suppose that two hundred thousand men, who are now employed in producing manufactures that only tend to gratify the vanity of a few rich people, were to be employed upon some barren and uncultivated lands, and to produce only half the quantity of food that they themselves consumed; they would be still more productive labourers with regard to the state than they were before, though their labour, so far from affording a rent to a third person, would but half replace the provisions used in obtaining the produce. In their former employment they consumed a certain portion of the food of the country and left in return some silks and laces. In their latter employment they consumed the same quantity of food and left in return provision for a hundred thousand men. There can be little doubt which of the two legacies would be the most really beneficial to the country, and it
will, I think, be allowed that the wealth which supported the two hundred thousand men while they were producing silks and laces would have been more usefully employed in supporting them while they were producing the additional quantity of food.

CHAPTER 18
The constant pressure of distress on man, from the principle of population, seems to direct our hopes to the future - State of trial inconsistent with our ideas of the foreknowledge of God - The world, probably, a mighty process for awakening matter into mind - Theory of the formation of mind - Excitements from the wants of the body - Excitements from the operation of general laws - Excitements from the difficulties of life arising from the principle of population.

THE view of human life which results from the contemplation of the constant pressure of distress on man from the difficulty of subsistence, by showing the little expectation that he can reasonably entertain of perfectibility on earth, seems strongly to point his hopes to the future. And the temptations to which he must necessarily be exposed, from the operation of those laws of nature which we have been examining, would seem to represent the world in the light in which it has been frequently considered, as a state of trial and school of virtue preparatory to a superior state of happiness. But I hope I shall be pardoned if I attempt to give a view in some degree different of the situation of man on earth, which appears to me to be more consistent with the various phenomena of nature which we observe around us and more consonant to our ideas of the power, goodness, and foreknowledge of the Deity.

It cannot be considered as an unimproving exercise of the human mind to endeavour to ‘vindicate the ways of God to man’ if we proceed with a proper distrust of our own understandings and a just sense of our insufficiency to comprehend the reason of all we see, if we hail every ray of light with gratitude, and, when no light appears, think that the darkness is from within and not from without, and bow with humble deference to the supreme wisdom of him whose ‘thoughts are above our thoughts’ ‘as the heavens are high above the earth.’

In all our feeble attempts, however, to ‘find out the Almighty to perfection’, it seems absolutely necessary that we should reason from nature up to nature’s God and not presume to reason from God to nature. The moment we allow ourselves to ask why some things are not otherwise, instead of endeavouring to account for them as they are, we shall never know where to stop, we shall be led into the grossest and most childish absurdities, all progress in the knowledge of the ways of Providence must necessarily be at an end, and the study will even cease to be an improving exercise of the human mind. Infinite power is so vast and incomprehensible an idea that the mind of man must necessarily be bewildered in the contemplation of it. With the crude and puerile conceptions which we sometimes form of this attribute of the Deity, we might imagine that God could call into being myriads and myriads of existences, all free from pain and imperfection, all eminent in goodness and wisdom, all capable of the highest enjoyments, and unnumbered as the points throughout infinite space. But when from these vain and extravagant dreams of fancy, we turn our eyes to the book of nature, where alone we can read God as he is, we see a constant succession of sentient beings, rising apparently from so many
specks of matter, going through a long and sometimes painful process in this world, but many of them attaining, ere the termination of it, such high qualities and powers as seem to indicate their fitness for some superior state. Ought we not then to correct our crude and puerile ideas of infinite Power from the contemplation of what we actually see existing? Can we judge of the Creator but from his creation? And, unless we wish to exalt the power of God at the expense of his goodness, ought we not to conclude that even to the great Creator, almighty as he is, a certain process may be necessary, a certain time (or at least what appears to us as time) may be requisite, in order to form beings with those exalted qualities of mind which will fit them for his high purposes?

A state of trial seems to imply a previously formed existence that does not agree with the appearance of man in infancy and indicates something like suspicion and want of foreknowledge, inconsistent with those ideas which we wish to cherish of the Supreme Being. I should be inclined, therefore, as I have hinted before, to consider the world and this life as the mighty process of God, not for the trial, but for the creation and formation of mind, a process necessary to awaken inert, chaotic matter into spirit, to sublimate the dust of the earth into soul, to elicit an ethereal spark from the clod of clay. And in this view of the subject, the various impressions and excitements which man receives through life may be considered as the forming hand of his Creator, acting by general laws, and awakening his sluggish existence, by the animating touches of the Divinity, into a capacity of superior enjoyment. The original sin of man is the torpor and corruption of the chaotic matter in which he may be said to be born.

It could answer no good purpose to enter into the question whether mind be a distinct substance from matter, or only a finer form of it. The question is, perhaps, after all, a question merely of words. Mind is as essentially mind, whether formed from matter or any other substance. We know from experience that soul and body are most intimately united, and every appearance seems to indicate that they grow from infancy together. It would be a supposition attended with very little probability to believe that a complete and full formed spirit existed in every infant, but that it was clogged and impeded in its operations during the first twenty years of life by the weakness, or hebetude, of the organs in which it was enclosed. As we shall all be disposed to agree that God is the creator of mind as well as of body, and as they both seem to be forming and unfolding themselves at the same time, it cannot appear inconsistent either with reason or revelation, if it appear to be consistent with phenomena of nature, to suppose that God is constantly occupied in forming mind out of matter and that the various impressions that man receives through life is the process for that purpose. The employment is surely worthy of the highest attributes of the Deity.

This view of the state of man on earth will not seem to be unattended with probability, if, judging from the little experience we have of the nature of mind, it shall appear upon investigation that the phenomena around us, and the various events of human life, seem peculiarly calculated to promote this great end, and especially if, upon this supposition, we can account, even to our own narrow understandings, for many of those roughnesses and inequalities in life which querulous man too frequently makes the subject of his complaint against the God of nature.
The first great awakeners of the mind seem to be the wants of the body. (It was my intention to have entered at some length into this subject as a kind of second part to the Essay. A long interruption, from particular business, has obliged me to lay aside this intention, at least for the present. I shall now, therefore, only give a sketch of a few of the leading circumstances that appear to me to favour the general supposition that I have advanced.) They are the first stimulants that rouse the brain of infant man into sentient activity, and such seems to be the sluggishness of original matter that unless by a peculiar course of excitements other wants, equally powerful, are generated, these stimulants seem, even afterwards, to be necessary to continue that activity which they first awakened. The savage would slumber for ever under his tree unless he were roused from his torpor by the cravings of hunger or the pinchings of cold, and the exertions that he makes to avoid these evils, by procuring food, and building himself a covering, are the exercises which form and keep in motion his faculties, which otherwise would sink into listless inactivity. From all that experience has taught us concerning the structure of the human mind, if those stimulants to exertion which arise from the wants of the body were removed from the mass of mankind, we have much more reason to think that they would be sunk to the level of brutes, from a deficiency of excitements, than that they would be raised to the rank of philosophers by the possession of leisure. In those countries where nature is the most redundant in spontaneous produce the inhabitants will not be found the most remarkable for acuteness of intellect. Necessity has been with great truth called the mother of invention. Some of the noblest exertions of the human mind have been set in motion by the necessity of satisfying the wants of the body. Want has not unfrequently given wings to the imagination of the poet, pointed the flowing periods of the historian, and added acuteness to the researches of the philosopher, and though there are undoubtedly many minds at present so far improved by the various excitements of knowledge, or of social sympathy, that they would not relapse into listlessness if their bodily stimulants were removed, yet it can scarcely be doubted that these stimulants could not be withdrawn from the mass of mankind without producing a general and fatal torpor, destructive of all the germs of future improvement.

Locke, if I recollect, says that the endeavour to avoid pain rather than the pursuit of pleasure is the great stimulus to action in life: and that in looking to any particular pleasure, we shall not be roused into action in order to obtain it, till the contemplation of it has continued so long as to amount to a sensation of pain or uneasiness under the absence of it. To avoid evil and to pursue good seem to be the great duty and business of man, and this world appears to be peculiarly calculated to afford opportunity of the most unremitted exertion of this kind, and it is by this exertion, by these stimulants, that mind is formed. If Locke's idea be just, and there is great reason to think that it is, evil seems to be necessary to create exertion, and exertion seems evidently necessary to create mind.

The necessity of food for the support of life gives rise, probably, to a greater quantity of exertion than any other want, bodily or mental. The Supreme Being has ordained that the earth shall not produce good in great quantities till much preparatory labour and ingenuity has been exercised upon its surface. There is no conceivable connection to our comprehensions, between the seed and the plant or tree that rises from it. The Supreme Creator might, undoubtedly, raise up plants of
all kinds, for the use of his creatures, without the assistance of those little bits of matter, which we call seed, or even without the assisting labour and attention of man. The processes of ploughing and clearing the ground, of collecting and sowing seeds, are not surely for the assistance of God in his creation, but are made previously necessary to the enjoyment of the blessings of life, in order to rouse man into action, and form his mind to reason.

To furnish the most unremitting excitements of this kind, and to urge man to further the gracious designs of Providence by the full cultivation of the earth, it has been ordained that population should increase much faster than food. This general law (as it has appeared in the former parts of this Essay) undoubtedly produces much partial evil, but a little reflection may, perhaps, satisfy us, that it produces a great overbalance of good. Strong excitements seem necessary to create exertion, and to direct this exertion, and form the reasoning faculty, it seems absolutely necessary, that the Supreme Being should act always according to general laws. The constancy of the laws of nature, or the certainty with which we may expect the same effects from the same causes, is the foundation of the faculty of reason. If in the ordinary course of things, the finger of God were frequently visible, or to speak more correctly, if God were frequently to change his purpose (for the finger of God is, indeed, visible in every blade of grass that we see), a general and fatal torpor of the human faculties would probably ensue; even the bodily wants of mankind would cease to stimulate them to exertion, could they not reasonably expect that if their efforts were well directed they would be crowned with success. The constancy of the laws of nature is the foundation of the industry and foresight of the husbandman, the indefatigable ingenuity of the artificer, the skilful researches of the physician and anatomist, and the watchful observation and patient investigation of the natural philosopher. To this constancy we owe all the greatest and noblest efforts of intellect. To this constancy we owe the immortal mind of a Newton.

As the reasons, therefore, for the constancy of the laws of nature seem, even to our understandings, obvious and striking; if we return to the principle of population and consider man as he really is, inert, sluggish, and averse from labour, unless compelled by necessity (and it is surely the height of folly to talk of man, according to our crude fancies of what he might be), we may pronounce with certainty that the world would not have been peopled, but for the superiority of the power of population to the means of subsistence. Strong and constantly operative as this stimulus is on man to urge him to the cultivation of the earth, if we still see that cultivation proceeds very slowly, we may fairly conclude that a less stimulus would have been insufficient. Even under the operation of this constant excitement, savages will inhabit countries of the greatest natural fertility for a long period before they betake themselves to pasturage or agriculture. Had population and food increased in the same ratio, it is probable that man might never have emerged from the savage state. But supposing the earth once well peopled, an Alexander, a Julius Caesar, a Tamberlane, or a bloody revolution might irrecoverably thin the human race, and defeat the great designs of the Creator. The ravages of a contagious disorder would be felt for ages; and an earthquake might unpeople a region for ever. The principle, according to which population increases, prevents the vices of mankind, or the accidents of nature, the partial evils arising from general laws, from obstructing the high purpose of the creation. It keeps the inhabitants of the earth always fully up to the level of the means of subsistence; and is constantly acting
upon man as a powerful stimulus, urging him to the further cultivation of the earth, and to enable it, consequently, to support a more extended population. But it is impossible that this law can operate, and produce the effects apparently intended by the Supreme Being, without occasioning partial evil. Unless the principle of population were to be altered according to the circumstances of each separate country (which would not only be contrary to our universal experience, with regard to the laws of nature, but would contradict even our own reason, which sees the absolute necessity of general laws for the formation of intellect), it is evident that the same principle which, seconded by industry, will people a fertile region in a few years must produce distress in countries that have been long inhabited.

It seems, however, every way probable that even the acknowledged difficulties occasioned by the law of population tend rather to promote than impede the general purpose of Providence. They excite universal exertion and contribute to that infinite variety of situations, and consequently of impressions, which seems upon the whole favourable to the growth of mind. It is probable, that too great or too little excitement, extreme poverty, or too great riches may be alike unfavourable in this respect. The middle regions of society seem to be best suited to intellectual improvement, but it is contrary to the analogy of all nature to expect that the whole of society can be a middle region. The temperate zones of the earth seem to be the most favourable to the mental and corporal energies of man, but all cannot be temperate zones. A world, warmed and enlightened but by one sun, must from the laws of matter have some parts chilled by perpetual frosts and others scorched by perpetual heats. Every piece of matter lying on a surface must have an upper and an under side, all the particles cannot be in the middle. The most valuable parts of an oak, to a timber merchant, are not either the roots or the branches, but these are absolutely necessary to the existence of the middle part, or stem, which is the object in request. The timber merchant could not possibly expect to make an oak grow without roots or branches, but if he could find out a mode of cultivation which would cause more of the substance to go to stem, and less to root and branch, he would be right to exert himself in bringing such a system into general use.

In the same manner, though we cannot possibly expect to exclude riches and poverty from society, yet if we could find out a mode of government by which the numbers in the extreme regions would be lessened and the numbers in the middle regions increased, it would be undoubtedly our duty to adopt it. It is not, however, improbable that as in the oak, the roots and branches could not be diminished very greatly without weakening the vigorous circulation of the sap in the stem, so in society the extreme parts could not be diminished beyond a certain degree without lessening that animated exertion throughout the middle parts, which is the very cause that they are the most favourable to the growth of intellect. If no man could hope to rise or fear to fall, in society, if industry did not bring with it its reward and idleness its punishment, the middle parts would not certainly be what they now are. In reasoning upon this subject, it is evident that we ought to consider chiefly the mass of mankind and not individual instances. There are undoubtedly many minds, and there ought to be many, according to the chances out of so great a mass, that, having been vivified early by a peculiar course of excitements, would not need the constant action of narrow motives to continue them in activity. But if we were to review the various useful discoveries, the valuable writings, and other laudable exertions of mankind, I believe we should find that more were to be attributed to
the narrow motives that operate upon the many than to the apparently more
enlarged motives that operate upon the few.

Leisure is, without doubt, highly valuable to man, but taking man as he is,
the probability seems to be that in the greater number of instances it will produce
evil rather than good. It has been not infrequently remarked that talents are more
common among younger brothers than among elder brothers, but it can scarcely be
imagined that younger brothers are, upon an average, born with a greater original
susceptibility of parts. The difference, if there really is any observable difference,
can only arise from their different situations. Exertion and activity are in general
absolutely necessary in one case and are only optional in the other.

That the difficulties of life contribute to generate talents, every day’s
experience must convince us. The exertions that men find it necessary to make, in
order to support themselves or families, frequently awaken faculties that might
otherwise have lain for ever dormant, and it has been commonly remarked that new
and extraordinary situations generally create minds adequate to grapple with the
difficulties in which they are involved.

CHAPTER 19
The sorrows of life necessary to soften and humanize the heart - The excitement of
social sympathy often produce characters of a higher order than the mere possessors
of talents - Moral evil probably necessary to the production of moral excellence -
Excitements from intellectual wants continually kept up by the infinite variety of
nature, and the obscurity that involves metaphysical subjects - The difficulties in
revelation to be accounted for upon this principle - The degree of evidence which
the scriptures contain, probably, best suited to the improvements of the human
faculties, and the moral amelioration of mankind - The idea that mind is created by
excitements seems to account for the existence of natural and moral evil.

THE sorrows and distresses of life form another class of excitements, which
seem to be necessary, by a peculiar train of impressions, to soften and humanize the
heart, to awaken social sympathy, to generate all the Christian virtues, and to
afford scope for the ample exertion of benevolence. The general tendency of an
uniform course of prosperity is rather to degrade than exalt the character. The
heart that has never known sorrow itself will seldom be feelingly alive to the pains
and pleasures, the wants and wishes, of its fellow beings. It will seldom be
overflowing with that warmth of brotherly love, those kind and amiable affections,
which dignify the human character even more than the possession of the highest
talents. Talents, indeed, though undoubtedly a very prominent and fine feature of
mind, can by no means be considered as constituting the whole of it. There are
many minds which have not been exposed to those excitements that usually form
talents, that have yet been vivified to a high degree by the excitements of social
sympathy. In every rank of life, in the lowest as frequently as in the highest,
characters are to be found overflowing with the milk of human kindness, breathing
love towards God and man, and, though without those peculiar powers of mind
called talents, evidently holding a higher rank in the scale of beings than many who
possess them. Evangelical charity, meekness, piety, and all that class of virtues
distinguished particularly by the name of Christian virtues do not seem necessarily
to include abilities; yet a soul possessed of these amiable qualities, a soul awakened
and vivified by these delightful sympathies, seems to hold a nearer commerce with the skies than mere acuteness of intellect.

The greatest talents have been frequently misapplied and have produced evil proportionate to the extent of their powers. Both reason and revelation seem to assure us that such minds will be condemned to eternal death, but while on earth, these vicious instruments performed their part in the great mass of impressions, by the disgust and abhorrence which they excited. It seems highly probable that moral evil is absolutely necessary to the production of moral excellence. A being with only good placed in view may be justly said to be impelled by a blind necessity. The pursuit of good in this case can be no indication of virtuous propensities. It might be said, perhaps, that infinite Wisdom cannot want such an indication as outward action, but would foreknow with certainly whether the being would choose good or evil. This might be a plausible argument against a state of trial, but will not hold against the supposition that mind in this world is in a state of formation. Upon this idea, the being that has seen moral evil and has felt disapprobation and disgust at it is essentially different from the being that has seen only good. They are pieces of clay that have received distinct impressions: they must, therefore, necessarily be in different shapes; or, even if we allow them both to have the same lovely form of virtue, it must be acknowledged that one has undergone the further process necessary to give firmness and durability to its substance, while the other is still exposed to injury, and liable to be broken by every accidental impulse. An ardent love and admiration of virtue seems to imply the existence of something opposite to it, and it seems highly probable that the same beauty of form and substance, the same perfection of character, could not be generated without the impressions of disapprobation which arise from the spectacle of moral evil.

When the mind has been awakened into activity by the passions, and the wants of the body, intellectual wants arise; and the desire of knowledge, and the impatience under ignorance, form a new and important class of excitements. Every part of nature seems peculiarly calculated to furnish stimulants to mental exertion of this kind, and to offer inexhaustible food for the most unremitted inquiry. Our mortal Bard says of Cleopatra:

Custom cannot stale
Her infinite variety.

The expression, when applied to any one object, may be considered as a poetical amplification, but it is accurately true when applied to nature. Infinite variety seems, indeed, eminently her characteristic feature. The shades that are here and there blended in the picture give spirit, life, and prominence to her exuberant beauties, and those roughnesses and inequalities, those inferior parts that support the superior, though they sometimes offend the fastidious microscopic eye of short-sighted man, contribute to the symmetry, grace, and fair proportion of the whole.

The infinite variety of the forms and operations of nature, besides tending immediately to awaken and improve the mind by the variety of impressions that it
creates, opens other fertile sources of improvement by offering so wide and extensive a field for investigation and research. Uniform, undiversified perfection could not possess the same awakening powers. When we endeavour then to contemplate the system of the universe, when we think of the stars as the suns of other systems scattered throughout infinite space, when we reflect that we do not probably see a millionth part of those bright orbs that are beaming light and life to unnumbered worlds, when our minds, unable to grasp the immeasurable conception, sink, lost and confounded, in admiration at the mighty incomprehensible power of the Creator, let us not querulously complain that all climates are not equally genial, that perpetual spring does not reign throughout the year, that God's creatures do not possess the same advantages, that clouds and tempests sometimes darken the natural world and vice and misery the moral world, and that all the works of the creation are not formed with equal perfection. Both reason and experience seem to indicate to us that the infinite variety of nature (and variety cannot exist without inferior parts, or apparent blemishes) is admirably adapted to further the high purpose of the creation and to produce the greatest possible quantity of good.

The obscurity that involves all metaphysical subjects appears to me, in the same manner, peculiarly calculated to add to that class of excitements which arise from the thirst of knowledge. It is probable that man, while on earth, will never be able to attain complete satisfaction on these subjects; but this is by no means a reason that he should not engage in them. The darkness that surrounds these interesting topics of human curiosity may be intended to furnish endless motives to intellectual activity and exertion. The constant effort to dispel this darkness, even if it fail of success, invigorates and improves the thinking faculty. If the subjects of human inquiry were once exhausted, mind would probably stagnate; but the infinitely diversified forms and operations of nature, together with the endless food for speculation which metaphysical subjects offer, prevent the possibility that such a period should ever arrive.

It is by no means one of the wisest sayings of Solomon that 'there is no new thing under the sun.' On the contrary, it is probable that were the present system to continue for millions of years, continual additions would be making to the mass of human knowledge, and yet, perhaps, it may be a matter of doubt whether what may be called the capacity of mind be in any marked and decided manner increasing. A Socrates, a Plato, or an Aristotle, however confessedly inferior in knowledge to the philosophers of the present day, do not appear to have been much below them in intellectual capacity. Intellect rises from a speck, continues in vigour only for a certain period, and will not perhaps admit while on earth of above a certain number of impressions. These impressions may, indeed, be infinitely modified, and from these various modifications, added probably to a difference in the susceptibility of the original germs, arise the endless diversity of character that we see in the world; but reason and experience seem both to assure us that the capacity of individual minds does not increase in proportion to the mass of existing knowledge. (It is probable that no two grains of wheat are exactly alike. Soil undoubtedly makes the principal difference in the blades that spring up, but probably not all. It seems natural to suppose some sort of difference in the original germs that are afterwards awakened into thought, and the extraordinary difference of susceptibility in very young children seems to confirm the supposition.)
The finest minds seem to be formed rather by efforts at original thinking, by endeavours to form new combinations, and to discover new truths, than by passively receiving the impressions of other men’s ideas. Could we suppose the period arrived, when there was not further hope of future discoveries, and the only employment of mind was to acquire pre-existing knowledge, without any efforts to form new and original combinations, though the mass of human knowledge were a thousand times greater than it is at present, yet it is evident that one of the noblest stimulants to mental exertion would have ceased; the finest feature of intellect would be lost; everything allied to genius would be at an end; and it appears to be impossible, that, under such circumstances, any individuals could possess the same intellectual energies as were possessed by a Locke, a Newton, or a Shakespeare, or even by a Socrates, a Plato, an Aristotle or a Homer.

If a revelation from heaven of which no person could feel the smallest doubt were to dispel the mists that now hang over metaphysical subjects, were to explain the nature and structure of mind, the affections and essences of all substances, the mode in which the Supreme Being operates in the works of the creation, and the whole plan and scheme of the Universe, such an accession of knowledge so obtained, instead of giving additional vigour and activity to the human mind, would in all probability tend to repress future exertion and to damp the soaring wings of intellect.
For this reason I have never considered the doubts and difficulties that involve some parts of the sacred writings as any ardent against their divine original. The Supreme Being might, undoubtedly, have accompanied his revelations to man by such a succession of miracles, and of such a nature, as would have produced universal overpowering conviction and have put an end at once to all hesitation and discussion. But weak as our reason is to comprehend the plans of the great Creator, it is yet sufficiently strong to see the most striking objections to such a revelation. From the little we know of the structure of the human understanding, we must be convinced that an overpowering conviction of this kind, instead of tending to the improvement and moral amelioration of man, would act like the touch of a torpedo on all intellectual exertion and would almost put an end to the existence of virtue. If the scriptural denunciations of eternal punishment were brought home with the same certainty to every man’s mind as that the night will follow the day, this one vast and gloomy idea would take such full possession of the human faculties as to leave no room for any other conceptions, the external actions of men would be all nearly alike, virtuous conduct would be no indication of virtuous disposition, vice and virtue would be blended together in one common mass, and though the all-seeing eye of God might distinguish them they must necessarily make the same impressions on man, who can judge only from external appearances. Under such a dispensation, it is difficult to conceive how human beings could be formed to a detestation of moral evil, and a love and admiration of God, and of moral excellence.

Our ideas of virtue and vice are not, perhaps, very accurate and well-defined; but few, I think, would call an action really virtuous which was performed simply and solely from the dread of a very great punishment or the expectation of a very great reward. The fear of the Lord is very justly said to be the beginning of wisdom, but the end of wisdom is the love of the Lord and the admiration of moral good. The denunciations of future punishment contained in the scriptures seem to be well calculated to arrest the progress of the vicious and awaken the attention of the careless, but we see from repeated experience that they are not accompanied with evidence of such a nature as to overpower the human will and to make men lead virtuous lives with vicious dispositions, merely from a dread of hereafter. A genuine faith, by which I mean a faith that shows itself in it the virtues of a truly Christian life, may generally be considered as an indication of an amiable and virtuous disposition, operated upon more by love than by pure unmixed fear.

When we reflect on the temptations to which man must necessarily be exposed in this world, from the structure of his frame, and the operation of the laws of nature, and the consequent moral certainty that many vessels will come out of this mighty creative furnace in wrong shapes, it is perfectly impossible to conceive that any of these creatures of God’s hand can be condemned to eternal suffering. Could we once admit such an idea, it our natural conceptions of goodness and justice would be completely overturned, and we could no longer look up to God as a merciful and righteous Being. But the doctrine of life and Mortality which was brought to light by the gospel, the doctrine that the end of righteousness is everlasting life, but that
the wages of sin are death, is in every respect just and merciful, and worthy of the great Creator. Nothing can appear more consonant to our reason than that those beings which come out of the creative process of the world in lovely and beautiful forms should be crowned with immortality, while those which come out misshapen, those whose minds are not suited to a purer and happier state of existence, should perish and be condemned to mix again with their original clay. Eternal condemnation of this kind may be considered as a species of eternal punishment, and it is not wonderful that it should be represented, sometimes, under images of suffering. But life and death, salvation and destruction, are more frequently opposed to each other in the New Testament than happiness and misery. The Supreme Being would appear to us in a very different view if we were to consider him as pursuing the creatures that had offended him with eternal hate and torture, instead of merely condemning to their original insensibility those beings that, by the operation of general laws, had not been formed with qualities suited to a purer state of happiness.

Life is, generally speaking, a blessing independent of a future state. It is a gift which the vicious would not always be ready to throw away, even if they had no fear of death. The partial pain, therefore, that is inflicted by the supreme Creator, while he is forming numberless beings to a capacity of the highest enjoyments, is but as the dust of the balance in comparison of the happiness that is communicated, and we have every reason to think that there is no more evil in the world than what is absolutely necessary as one of the ingredients in the mighty process.

The striking necessity of general laws for the formation of intellect will not in any respect be contradicted by one or two exceptions, and these evidently not intended for partial purposes, but calculated to operate upon a great part of mankind, and through many ages. Upon the idea that I have given of the formation of mind, the infringement of the general law of nature, by a divine revelation, will appear in the light of the immediate hand of God mixing new ingredients in the mighty mass, suited to the particular state of the process, and calculated to give rise to a new and powerful train of impressions, tending to purify, exalt, and improve the human mind. The miracles that accompanied these revelations when they had once excited the attention of mankind, and rendered it a matter of most interesting discussion, whether the doctrine was from God or man, had performed their part, had answered the purpose of the Creator, and these communications of the divine will were afterwards left to make their way by their own intrinsic excellence; and, by operating as moral motives, gradually to influence and improve, and not to overpower and stagnate the faculties of man.

It would be, undoubtedly, presumptuous to say that the Supreme Being could not possibly have effected his purpose in any other way than that which he has chosen, but as the revelation of the divine will which we possess is attended with some doubts and difficulties, and as our reason points out to us the strongest objections to a revelation which would force immediate, implicit, universal belief, we have surely just cause to think that these doubts and difficulties are no argument against the divine origin of the
scriptures, and that the species of evidence which they possess is best suited
to the improvement of the human faculties and the moral amelioration of
mankind.

The idea that the impressions and excitements of this world are the
instruments with which the Supreme Being forms matter into mind, and
that the necessity of constant exertion to avoid evil and to pursue good is
the principal spring of these impressions and excitements, seems to smooth
many of the difficulties that occur in a contemplation of human life, and
appears to me to give a satisfactory reason for the existence of natural and
moral evil, and, consequently, for that part of both, and it certainly is not a
very small part, which arises from the principle of population. But, though,
upon this supposition, it seems highly improbable that evil should ever be
removed from the world, yet it is evident that this impression would not
answer the apparent purpose of the Creator, it would not act so powerfully
as an excitement to exertion, if the quantity of it did not diminish or
increase with the activity or the indolence of man. The continual variations
in the weight and in the distribution of this pressure keep alive a constant
expectation of throwing it off.

Hope springs eternal in the Human breast,
Man never is, but always to be blest.

Evil exists in the world not to create despair but activity. We are not
patiently to submit to it, but to exert ourselves to avoid it. It is not only the
interest but the duty of every individual to use his utmost efforts to remove
evil from himself and from as large a circle as he can influence, and the more
he exercises himself in this duty, the more wisely he directs his efforts, and
the more successful these efforts are, the more he will probably improve and
exalt his own mind and the more completely does he appear to fulfil the will
of his Creator.
