Enhanced Cellphone-based Multi-level Marketing for Microfinance (Milestone 4 - Sustainability)
Business Model

- Returning borrowers have much higher payback rate. When people borrow more than 3 times, their payback is similar to loans with collateral, while about half of the first time borrower cannot payback their loans at all.
- MFI makes money from loan to returning borrower and subsidize the first time borrowers.
- Attract new borrowers to have more returning borrowers.

MLM and MicroFinancing

- The return of loan satisfies normal distribution
- The more data you have, the smaller the std dev
- The cut off point is the minimum return that MFI wants to have to be profitable, if the original one is $2\sigma$, it means that 97.73% of customers will pay back your loan. When you have 100 times more data, the cutoff point became $20\sigma$, which increases the total payback rate significantly, almost everybody will pay back the loan. So, you want to reach out to more customers
- MLM is an ideal solution

\[ \sigma_{\text{mean}} = \frac{\sigma}{\sqrt{N}} \]

Keys for Sustainability

- When you have more data, you can do a better profiling for loan approval, and you will have a better estimation of the payback rate with lower variance. Then, you can lower the interest rates associated with the loan, which will further increase the payback rate. Meanwhile, by reaching out to more people, you significantly increase the N, and lower your overall risks.
